ABSTRACT

This annual report provides an overview of the status of vocational education during school year 1980-81. It includes final data for school year 1979-80 obtained through the Vocational Education Data System (VEDS), the national vocational education reporting and accounting system. Part 1 of the report describes the status of vocational education during 1979-80 in terms of the requirements of the Vocational Education Amendments of 1976, namely appropriations, expenditures, students, vocational student organizations, teachers, facility and equipment, program improvement, state and local administration, occupational information, and compliance and quality reviews. Data are from the National Center for Education Statistics, United States Department of Education. Part 2 of the report focuses on vocational education's responsiveness to and impact on national needs for economic revitalization, defense preparedness, high technology, inner-city and rural initiatives, agriculture, domestic energy and mineral production, and entrepreneurship. Each national need is first discussed, and then vocational education's response, including programs, training, services, and (research) studies, is described. Appendixes, constituting about half of the document, include 17 tables regarding funding and 11 tables dealing with enrollment for 1979-80. (YLB)

## FOREWORD

This annual report on the status of vocational education during school year 1980-81 is mandated by the Vocational Education Act of 1963, as amended (Title II, Public Law 94-482). The report includes final data for school year 1979-80 obtained through the Vocational Education Data System (VEDS), which is the national vocational education reporting and accounting system also mandated by the Act. Fiscal year 1980 is the States' fiscal year which began July 1, 1979 and ended June 30, 1980. This is also referred to as school year 1979-80. Throughout this report we will use terms such as 1978-79 and 1979-80 to mean the States' school year from July 1 of one year to June 30 of the next. Data sources other than VEDS refer to fiscal year 1981.

The focus of this report is to provide an overview of the progress and status of vocational programs conducted in the field during school year 1980-81, rather than the issue of the Federal role in vocational education. Although the current legislation has caused some problems in the State management of vocational education, program service to clients and the operation of local programs are largely successful in spite of the legislation. Current Federal deregulation efforts and development of new legislation to consolidate existing vocational and adult education are an administrative priority to reduce the Federal role and allow States and localities to assume greater control of their programs.

Part I of this report describes the status of vocational education during 1979-80 in terms of appropriations, expenditures, students, vocational student organizations, teachers, facilities and equipment, program improvement, State and local administration, occupational information, and compliance and quality reviews.

Part II focuses on vocational education's responsiveness to and impact on national needs for economic revitalization, defense preparedness, high technology, inner-city and rural initiatives, agriculture, domestic energy and mineral production, and entrepreneurship.

Data contained in Part I were contributed by the National Center for Education Statistics, U.S. Department of Education. The ready assistance provided by the NCES staff is greatly appreciated.

Response examples featured in Part II were abstracted or adapted from a variety of sources including the National Center for Research in Vocational Education at the Ohio State University, the American Vocational Association, and the Illinois State Board of Education. Additional information was provided by State staff, particularly in Michigan, Massachusetts, and Maryland. Finally, background information in specific areas was forthcoming from the U.S. Department of Defense, the U.S. Department of Labor, and the House Armed Services Committee of the United States Congress. All of these contributions are gratefully acknowledged.

This report was prepared by the Policy Analysis and Legislation Staff of the Office of Vocational and Adult Education (OVAE), U.S. Department of Education, in cooperation with other OVAE units, and was reviewed by all major units within the Department.

Robert M. Worthington, Ph.D.  
Assistant Secretary for  
Vocational and Adult Education

## SUMMARY

In school year 1979-80, as in previous years, vocational education helped to prepare persons of all ages in all communities for work. Although total enrollments in 1979-80 decreased by approximately 375,000 to a new total of 16.5 million students, the enrollment of females, handicapped, and disadvantaged increased. Vocational education also continued to serve other special population groups such as displaced homemakers, Indians, the incarcerated, those with limited English proficiency, and students from the Appalachian Region.

Federal and State and local expenditures for vocational education in 1979-80 reached an all-time high of \$6.8 billion. This was an absolute increase of \$320 million from the previous year. Because of the effects of inflation in that year, however, total support actually decreased.

During school year 1980-81, vocational education sharpened its focus to more adequately address national needs while still serving the special populations as required by the Vocational Education Act. Two of the most important national problems identified in 1980-81 were economic revitalization and improving defense preparedness. Vocational educators realized that skilled workforce development would be essential to help address these and other national needs.

State vocational education systems have already offered programs that respond to national needs. Examples of programs that have addressed economic revitalization include retraining unemployed steel workers in air conditioning, refrigeration and heating, and small engine repair; retraining unemployed elementary school teachers as computer programmers and analysts; creating apprenticeship training programs with local businesses to reduce skilled worker shortages; and developing customized "quick-start" training programs for business and industry new to an area. Programs that have addressed defense preparedness include vocational instructors working full time at a shipbuilder's site to train company employees; special programs to train computer and electronics technicians for the Lockheed Missiles and Space Company; and a \$13 million contract between the United States Navy and four postsecondary technical institutions to train active-duty naval air technicians.

Vocational education continues to provide a consistent flow of skilled, entry-level workers from its regular secondary and postsecondary programs, while meeting the needs of special population groups. In addition, vocational education has provided flexible, innovative programs that address the skilled workforce development that is needed to help solve our Nation's problems.

I STATUS OF VOCATIONAL EDUCATION IN 1981

Vocational education, through its many programs, services and activities, has the primary mission of preparing persons of all ages in all States for work, while also emphasizing equal educational opportunities for males and females, the disadvantaged, the handicapped, students with limited English-proficiency, Indians, and the incarcerated. Vocational education also retrains and upgrades adult workers to help them keep abreast of the changing needs of business and industry. These programs are designed to provide incentives that encourage workers to acquire new, higher-level skills which will enable them to work in occupational areas where the greatest expansion is expected in the future. These efforts help to reduce the number of workers who are displaced, unemployed or underemployed because their skills are no longer in demand. In addition to meeting the educational needs of individuals, vocational education makes significant contributions toward achieving national goals of improved productivity and economic development.

The following information describes the status of the vocational education enterprise in terms of the requirements of the Vocational Education Amendments of 1976.

#### APPROPRIATIONS

The fiscal year 1979 Federal appropriations for vocational education were available to the States for expenditure during the States' fiscal year 1980, which began July 1, 1979. The following table lists the total Federal appropriations. Funds listed for bilingual vocational training and programs of national significance, however, are Federal discretionary funds which are dispersed through competitive contracts and grants. State advisory councils' funds are dispersed directly to the councils and not through the State Boards of Vocational Education. This reduces the amount made available directly to these Boards.

TABLE 1     Federal appropriations for vocational education, fiscal year 1979

Basic grants (Section 120) .....	\$474,766,000
Program improvement (Section 130) .....	112,317,000
Programs of national significance (Section 171) .....	10,000,000
Special programs for the disadvantaged (Section 140) .....	20,000,000
Consumer and homemaking education (Section 150).....	43,497,000
State advisory councils (Section 105) .....	6,073,000
Bilingual vocational training (Section 183) .....	2,800,000
State planning (Section 102(d)) .....	5,000,000
Smith-Hughes permanent appropriation .....	7,161,455
Total	\$681,614,455
Total net disbursements to State Boards	\$662,741,455

This was an overall increase of almost \$40 million from the previous year. Federal funds appropriated for use in fiscal year 1981 (the results of which will be reported next year) amounted to over \$784 million, an increase of \$103 million from the 1980 figures listed above.

## EXPENDITURES

State expenditures of Federal Vocational Education Act funds almost always vary from amounts appropriated for any given year by the Congress. This occurs because States have a 27-month period in which to spend any single year's appropriation. In 1979-80 over \$640 million were expended, including carryover funds from previous years and planning funds available under Section 102(d). This figure does not include unliquidated obligations. This was an increase of \$75 million from 1978-79 expenditures. State and local expenditures for vocational education were almost \$6.2 billion in 1979-80, an increase from \$5.9 billion in 1978-79. The ratio of State and local expenditures to Federal expenditures is 9.6:1. Chart A (p. 5) shows the overall increase in expenditures for vocational education since 1972. Table 2 (p. 6) provides details on expenditures for 1979-80.

## PROGRAMS AND STUDENTS

In school year 1979-80, 16,453,006 students were served nationwide in vocational education (50 States and the District of Columbia only), including 10.1 million secondary and 6.4 million postsecondary and adult students. These numbers show a slight decrease from school year 1978-79 when a total of 17,033,620 students were served under this program (total United States and Outlying Areas). Most of this decrease is attributable to the fact that total secondary school enrollment is decreasing. In addition, the 1979-80 figures do not include any enrollments for the Outlying Areas which reported 206,000 enrollments in 1978-79. The Outlying Areas include American Samoa, Guam, Northern Marianas, Puerto Rico, the Trust Territory, and the Virgin Islands.

### Occupationally Specific Programs

The 1976 Amendments gave major emphasis to areas such as increasing service to target populations and working toward sex equity in all programs. While considerable attention was given to the need for accurate occupational demand data in planning basic programs of vocational instruction, little mention was made of these programs, themselves. These basic programs must, and do, provide the vehicle for accomplishing the Act's special-interest thrusts. Since the main purpose of vocational education is to provide occupationally specific instruction, the majority of students are enrolled in these programs.

During the 1979-80 school year, enrollment was 10,341,000 in the following occupational program areas: agriculture; business and office; marketing and distribution; health occupations; vocational home economics; trade and industrial; and technical education. Since the major focus of this part of the report reflects the Act's concern with target populations, it is appropriate at least to define the basic vocational programs that serve these populations. It should also be noted that the responses to national needs described in Part II have been accomplished almost exclusively through the occupationally specific programs that are briefly defined below.

<b>GRAND TOTAL</b>	<b>\$640,242,411</b>	<b>\$6,169,005,676</b>	<b>\$6,809,248,087</b>

\*Funds in Section 110 are duplicate counts of funds listed in Sections 120 and 130 and are not added in the Grand Total figures.

Of the students enrolled in these occupationally specific programs, a total of 1,857,934 completed the program and were available for employment. This figure does not include those who obtained sufficient skills and left the program before completion. Further information on the numbers of completers by program and institution are listed in Appendix 2, Tables E-8 to E-11. Followup on program completers from school year 1978-79 are not yet available from the National Center for Education Statistics.

#### Agriculture

Agriculture is comprised of groups of instructional programs that prepare individuals to apply scientific knowledge and methods and technical skills in support of agribusiness and agricultural activities concerned with the production and propagation of crops, animals, supplies and services, mechanics, products processing and marketing, and horticulture. This comprehensive program also prepares individuals for activities involving the conservation and/or improvement of natural resources such as: air, soil, water, land, fish, and wildlife for economic and recreational purposes.

#### Business and Office

This is a group of instructional programs that prepares individuals for a variety of activities in planning, organizing, directing, and controlling all business office systems and procedures. It includes instruction in preparing, transcribing, systematizing, and preserving written communications and records; preparing and analyzing financial records; collecting accounts and receiving and disbursing money; gathering, processing, and distributing information and mail; operating office machines, computers and electronic data processing equipment; storing, distributing, and accounting for inventories of materials; and operating telephone switchboards and delivering messages.

#### Marketing and Distribution

These are groups of instructional programs that prepare individuals for occupations associated with the flow of industrial and consumer goods in channels of trade, or the provision of services to consumers or users. These programs are concerned with marketing, sales, distribution, merchandising, and management, including ownership and management of enterprises engaged in marketing. The programs prepare individuals to perform one or more of the marketing functions, such as selling, buying, pricing, promoting, financing, transporting, storing, marketing research, and marketing management. In addition, these instructional programs include varying emphases on technical knowledge of products or services marketed, related communication and computation skills, and abilities and attitudes associated with human relations and private enterprise.

#### Health Occupations

This group of instructional programs prepares individuals to assist qualified health professionals in providing diagnostic, therapeutic,

preventive, restorative, and rehabilitative services to patients in health care facilities, the home, and the community. The programs include instruction in dental services, diagnostic and treatment services, medical laboratory technologies, mental health and human services, nursing and related services, and ophthalmic services.

#### Vocational Home Economics

This is a group of instructional programs that emphasizes the acquisition of competencies needed for securing and holding employment at entry and advanced levels of specific vocations that include: providing services to individuals and families; assisting professional home economists and professionals in fields related to home economics in industry, business, and public and private agencies; and other services and/or assistance directly related to one or more of the home economics subject matter areas. These areas include: consumer and homemaking; child care and guidance; clothing, apparel and textiles; food production; home furnishings and equipment; and institutional, home management, and supporting services.

#### Trade and Industrial

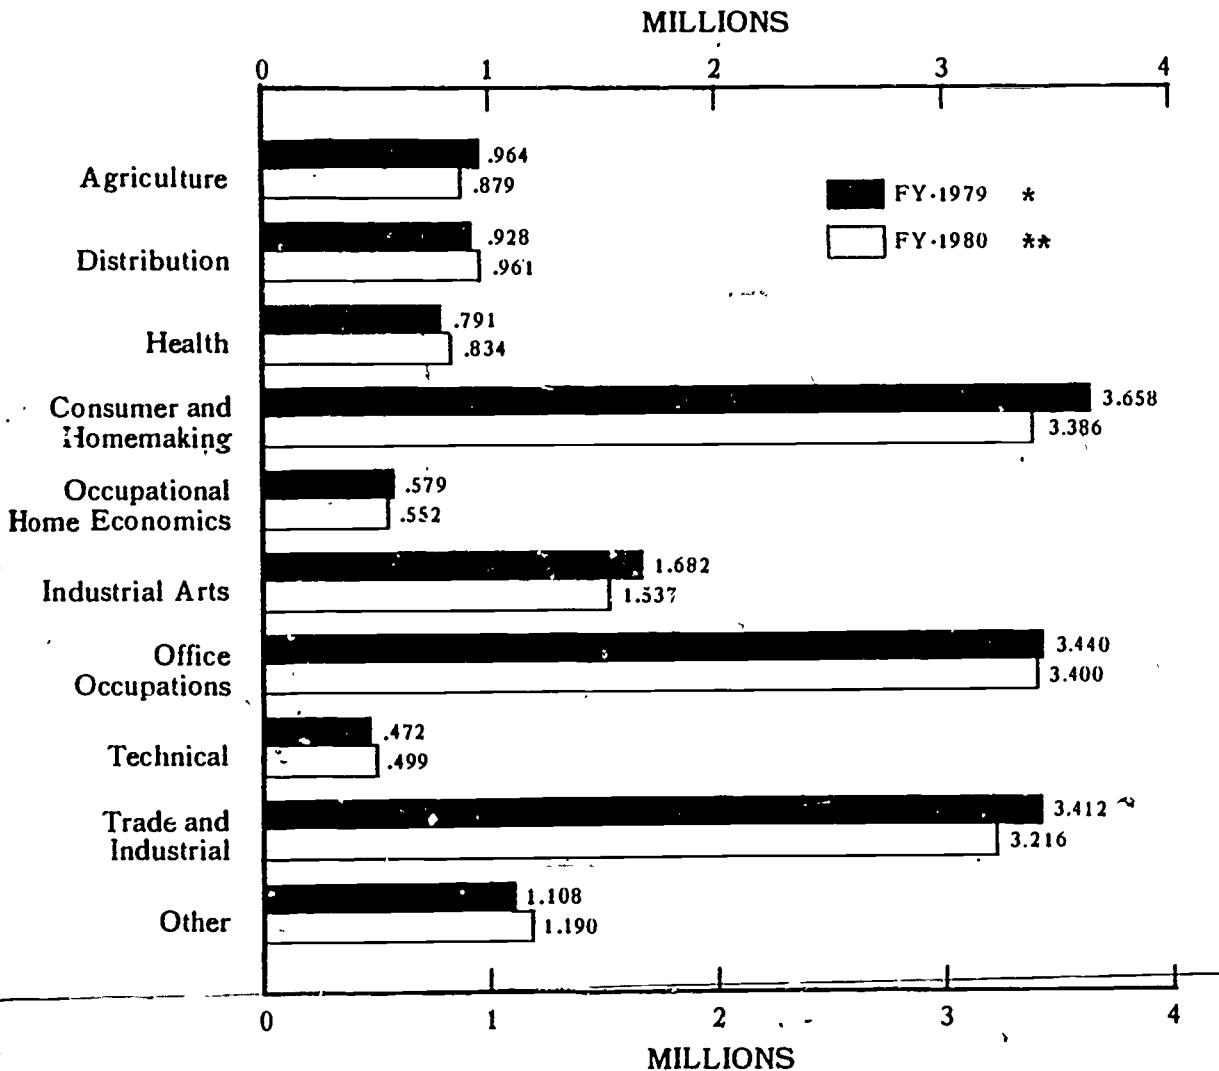

Trade and industrial education involves occupations in both the manufacturing and service sectors of the economy. A large number of occupationally specific programs serve in-school and out-of-school youth and adults who need, want, and can profit from instruction that prepares them to enter or advance in careers for which there is proven labor market demand.

Trade and industrial occupations are classified by levels ranging from operator to skilled craftsman and technician. Occupations requiring a baccalaureate or higher degree are excluded from Federal support under the Act. Programs in this category not only prepare individuals for industry-related occupational areas such as the construction trades, metal working trades, automotive services, heating and air conditioning, graphic arts, and wood trades, but also for service-sector occupational fields such as cosmetology. Typical functions performed by graduates of these programs include layout, designing, producing, repairing, providing various kinds of personal or public services, and performing as middle managers. Almost all of the apprenticeable trades are found in this category and various types of supervisory training are usually classified as being contained in it. While not restricted to trade and industrial education, both the cooperative method of instruction and entrepreneurship training are very common elements in these programs.

Because of its unusually broad scope and diversity of programs, trade and industrial education has traditionally been judged the central instructional cluster in vocational education. However, because of the decline of the manufacturing sector, accelerating technological change, the shift to service occupations, and the aging of the Nation's population, among other factors, other categories such as technical education and health occupations education are challenging this position of dominance.

## Enrollments

### In Vocational Education (VEA) By Program Area

Source: NCES/VEDS

\* United States and Outlying Areas

\*\* 50 States and the District of Columbia

## Technical

Programs in technical education prepare individuals to enter the labor market in the occupational area between the skilled craftsman and the professional such as the physician, the engineer, and the scientist. The program of instruction is designed to prepare a person for a cluster of job opportunities in a specialized field of technology and is usually offered at the postsecondary level.

This concludes the definitions for the seven occupationally specific types of vocational education programs. Chart B (p.9) compares total enrollment by program areas during school years 1978-79 and 1979-80 for these seven areas. Enrollments in marketing and distribution, health occupations, and technical education increased slightly from 1978-79, even though the figures for 1979-80 exclude enrollment from the Outlying Areas. However, there is very little overall change in the enrollment figures for the various programs. The Chart also includes enrollment in the non-occupationally specific programs that are described in the next section.

The concluding part of this section provides an in-depth look at a method of instruction that is becoming increasingly important to all occupationally specific programs in vocational education.

## Cooperative Vocational Education

Reauthorized by the Vocational Education Amendments of 1976, cooperative vocational education is planned and supervised by school personnel and consists of periods of employment alternated with study in school. While not a "program" in the same sense as the seven programs defined above, it is a method of instruction that can be used in all such occupationally specific programs. Students enrolled in cooperative vocational education are governed by a written agreement between the school and the employer. Cooperative vocational education provides students with skill development, related classroom instruction and an opportunity to develop attitudes which prepare them for employment.

During the 1979-80 school year, 620,663 co-op students were enrolled in the secondary, postsecondary and adult levels. All occupational areas were included. These cooperative enrollments by level, are as follows:

Total secondary enrollment	522,438
Total postsecondary and adult enrollment	73,225
Community Colleges (63,013)	
Area Vocational Technical Institutes(3,311)	
Evening and Adult Classes (6,901)	
Ten States partially reporting	25,000 (est.)

Cooperative vocational education appears to work very well in motivating students. For these students, the benefits in addition to earnings are very important. These benefits include: having an opportunity to test career goals in a meaningful way before a final career decision must be made; facilitating an effective transition from school to work; fulfilling

personal needs and aspirations; developing attitudes and skills essential to satisfactory working relationships; and obtaining a current employment record. For the employing community, participants in cooperative education programs are attractive because they provide employers with a source of motivated employees who can be trained with minimum expense and can be observed prior to full-time employment.

For many communities cooperative vocational education is a practical way to keep some qualified young people in the community. The need to purchase expensive specialized equipment and laboratory facilities in the schools can be reduced, since students receive some of their training using the employers' equipment. Schools can often teach more students in a given facility by carefully scheduling work and school periods. Moreover, immediate application of learning in realistic settings contributes to the instructional process.

According to the latest available data, States reported that the estimated earned wages of cooperative vocational education students was over \$2.5 billion during the 1979-80 school year. State and Federal income taxes and FICA taxes are paid on these wages by the students. There is also a return to the economy of the local communities in the form of student purchases and savings.

Through the Targeted-Jobs-Tax-Credit (TJTC) Program, which is part of the Economic Recovery Tax Act of 1981, employers may claim a tax credit for wages paid to employees in nine targeted groups. Students aged 16 but not yet 20, who are economically disadvantaged and enrolled in a cooperative education program, are classified as one of the nine targeted groups. An extension of the TJTC Program as it is applied to cooperative vocational education has been requested by this Administration.

#### Non-Occupationally Specific Programs

Although economic revitalization needs have spotlighted vocational education's capacity to train students for specific jobs or job clusters, the enterprise has always had a wider scope than this. For many years, it has been concerned with the overall quality of American family life, the introduction of young students into the world of work, and the needs of both youth and adults for professional guidance in selecting careers. Without these non-occupationally specific elements (as well as research and developmental programs that undergird the entire enterprise), vocational education would be little more than skill training tacked onto regular academic education. The programs described in this section are three that received special emphasis in the current Vocational Education Act. As is the case with occupationally specific programs, these programs also are widely used to serve target populations.

#### Consumer and Homemaking

The goal of consumer and homemaking education is to improve the quality of home life by helping students develop skills in decisionmaking and managing resources. Students are given instruction in a variety of areas of family

concern, including nutrition, clothing, housing for the individual and the family, rearing children, and maintaining satisfying human relations. In addition, consumer and homemaking education has an economic benefit in that it assists men and women to prosper in their dual roles as members of the workforce and managers of their households.

In school year 1979-80 there were 3,385,736 students enrolled in consumer and homemaking programs, nearly 1.3 million from economically depressed areas. Because of declining secondary school enrollments, total enrollment in consumer and homemaking decreased by more than 270,000 from the previous year, and enrollments in economically depressed areas decreased by over 165,000.

Consumer and homemaking expenditures totaled more than \$501 million in school year 1979-80. Of this total, \$43.8 million was Federal funds, and \$457.2 million was State and local. Total expenditures increased over \$21 million from the previous year, most of which was State and local funds. Federal expenditures increased by \$2 million.

Consumer and homemaking programs have historically served many disadvantaged and minority persons. In addition, the program has been adapted to serve the needs of such diverse populations as single parents, teenage mothers, divorced parents, and dual wage earners. States have made efforts to meet the unique needs of these populations by offering classes in convenient locations. Neighborhood centers, Indian reservations, senior citizen centers, churches, homes, migrant camps, and even mobile units have been used to provide consumer and homemaking programs to those who need them. Programs have been "taken to the people" wherever they could be reached in groups.

#### Industrial Arts

Industrial arts curricula provides experience based upon nationally relevant economic/industrial clusters such as construction, manufacturing, communication, and transportation. The program involves the occupational orientation, growth, and guidance of students for modern industrial society. It does this through an instructional program that includes the technical, consumer, occupational, vocational, organizational, social, historical and cultural aspects of industry and technology. While industrial arts builds upon and fosters general education learning experiences, its scope and sequence are directly related to vocational, technical and career education concepts.

In school year 1979-80, a total of \$172.5 million was expended on more than 1.5 million pre-vocational industrial arts students. The Federal portion of this expenditure was \$5.4 million. These funds were used to expand career guidance services, improve the quality of instruction, and develop individualized instruction.

The U.S. Department of Education, through OVAE, has supported and participated in the development and validation of program standards for industrial arts. Instructional programs can now be consistently assessed against

these standards. In addition, three instructional guides were developed. The first assists classroom teachers in making the American Industrial Arts Student Association an integral part of the curriculum. The second alerts industrial arts educators to the vital role they can play in increasing awareness of career options for all students. This guide provides technical assistance to help teachers increase female participation in industrial arts programs and assure equitable treatment of females and males. The third guide assists in the overall development of appropriate industrial arts programs for special needs populations. Industrial arts professionals have responded positively to the standards and the accompanying guides, and have accepted them for use in their programs. Professional associations are holding regional workshops on how to implement the standards at the local level.

The expanding use of industrial arts to support vocational education has caused a shortage of qualified teachers. This shortage was documented at 1,500 at the beginning of school year 1980-81. The professional associations, in cooperation with the Office of Vocational and Adult Education, are working to develop strategies to overcome this problem.

#### Guidance and Counseling

Guidance and counseling is a mandated supportive service under the Vocational Education Act. These services are intended to improve a State's vocational education program by providing assistance directly to students to help them realistically choose their future occupations.

Because of the structure of the Vocational Education Data System, no information is collected on actual numbers of students who receive guidance and counseling services. However, all States expended funds for this purpose in school year 1979-80. During this school year, \$254 million was spent for vocational guidance and counseling services, compared to \$216.3 million during school year 1978-79. However, the Federal share of this total expenditure decreased from \$41.1 million to \$40.7 million during this same interval. Consequently, the Federal percentage dropped from 19 percent in 1978-79 to 16 percent in 1979-80.

Typical services provided with guidance and counseling funds include: career counseling for adults, handicapped, and disadvantaged students; development of career information materials; workshops for counselors, teachers and administrators to acquire skills for implementing comprehensive career guidance programs; and dissemination of career information.

The Department of Education also funded vocational guidance and counseling projects as part of the Projects of National Significance. One project continuing in 1981 was "Guidance Team Training with Emphasis on Guidance for Vocations and Learners with Special Needs." As a result of this project, community teams developed and implemented plans which helped them improve the career guidance programs in their own communities. Detailed information on how these teams developed and implemented their action plans is available for use by other communities that wish to improve their

guidance services.

This project has had numerous positive effects on the community agencies involved, the citizens, and the team members. The community agencies shared funds, staff, and facilities with other organizations; developed new products; modified their goals, plans, and priorities as necessary; and used training modules from the National Center for Research in Vocational Education. The citizens involved received information about a career guidance program in their community; talked and worked together for the first time; showed greater awareness of community career guidance needs; demonstrated more positive attitudes toward career guidance; participated in career guidance activities; and made constructive changes in their careers and lives. Team members reported positive outcomes such as changed attitudes towards career guidance; new knowledge of available community resources; new visibility and credibility in the community because of membership on the team; and being asked to join or make a presentation to other groups and provide training to the staff or representatives of community organizations.

#### Target Populations Programs

As previously stated, much of the current Vocational Education Act focuses on target or priority populations that the system as a whole must include, while providing services to all populations. The previous two sections have described the basic programs that serve these populations. These basic programs are adjusted for these special groups of students either by adding supplementary services or by modifying facilities and equipment. In a few instances (e.g., educable-retarded students), curriculum content is changed. The Act's sex-equity thrust required still different approaches; for example, changing admission requirements, revising recruitment and instructional materials to avoid sex stereotyping, and providing incentives for nontraditional programs.

In any event, it should be understood that this section, while describing several actual programs such as those for Indians and Appalachia, largely reports on how vocational education is serving special kinds of students. The use of the term "programs" in regard to these students does not imply the existence of a third major type of vocational education completely separate from those already described in the preceding two sections.

#### Handicapped Students

Making the transition from school to work is a major step for most young men and women, but especially so for those who are handicapped. These handicapped students must have employment skills if they are to compete in the job market. Vocational education has the major role for teaching handicapped youth who are enrolled in school the specific job skills that will help them become employed.

During school year 1979-80, 400,575 handicapped students were served in vocational education. This figure is significantly different from both the 1978-79 total of 235,988, and the 1977-78 total of 360,151. However, the

previous enrollment figures must be viewed with some caution because of inconsistent practices among States in counting handicapped enrollments. Beginning with the 1978-79 school year, all handicapped students served were to be reported. Some States, however, counted only those students receiving supplementary services. This confusion was largely corrected in 1979-80.

A profile, by handicapping condition, of all handicapped students enrolled in vocational education shows the same distribution as those served by non-vocational special education. According to the Vocational Education Civil Rights Survey, 1979, slightly over 36 percent of all handicapped persons enrolled in vocational education in comprehensive high schools and area vocational centers are mentally retarded and 37 percent have a specific learning disability such as dyslexia. Of the remainder, 7 percent are seriously emotionally disturbed, 2 percent are orthopedically impaired, 3 percent are visually handicapped, and 4 percent are deaf or hard of hearing. Another 10 percent are "other health impaired" and 5 percent are multi-handicapped.

Federal expenditures in the 1979-80 school year for supplementary or excess-cost services for handicapped students totaled more than \$63 million, an increase of \$10 million from 1978-79. State and local expenditures increased by \$11 million to a total of \$132 million in 1979-80. See Table 3 (p.18) for a comparison of the expenditures in these two school years.

Vocational education has progressed in serving handicapped persons during the past decade. Significant progress has been made in three areas: (a) developing awareness of the need and responsibility to integrate handicapped persons into the vocational education population; (b) developing positive attitudes toward serving the handicapped; and (c) learning to teach handicapped students in regular vocational education classes.

The main tool for measuring success in educating the handicapped is still enrollment. Enrollment figures, however, tell only part of the story. The frequency of mainstreaming is another success indicator.

The National Institute of Education (NIE) in its study on vocational education identified the excess cost provisions as disincentives for mainstreaming the handicapped. However, States do not appear to have responded to the excess cost provisions in the manner predicted. According to the 1979-80 VEDS data, 78 percent of handicapped students served in vocational education are in mainstream programs. Abt Associates, Inc., in a study funded by NIE, Implementation of the Education Amendments of 1976: A Study of State and Local Compliance and Evaluation Practices, December 1980, indicated that States were reporting progress in increasing the mainstreaming of handicapped students. It appeared that States were using Federal funds to sponsor fewer separate programs than previously.

The National Institute of Education also identified the separate matching provisions for the setasides as a potential burden on the States and localities. Many States thought the matching provisions would make it difficult to spend the setasides. NIE stated that, "Nonetheless, many States have had no problems generating the required match, and few seem to have burdened needy LEA's." State officials indicated that, "... the problem stems from the lack of clear examples of and consistent technical advice on permissible excess cost expenditures."

As the Department of Education provided technical assistance and the States gained experience in administering this Act, the potential problems with the matching requirements were avoided. VEDS data from 1978, 1979, and 1980 indicated that most States were able to match the Federal excess cost funds.

In 1978, 49 States met the matching requirements and 48 overmatched. In 1979, 49 States met the matching requirements and 45 overmatched. Preliminary data for 40 States for 1980 show that 39 met the match and 35 States overmatched. The 1980 data are not final and are subject to change. Of the total nationwide Federal setaside of \$51,662,911 in 1978, only .74 percent lapsed. In 1979, of the \$53,833,996 total Federal setaside, only .26 percent lapsed. Preliminary data for 1980 indicate that approximately .24 percent may lapse. This figure may change when final 1980 financial reports are received from all States.

#### Disadvantaged Students

In addition to handicapped students, there are many other youth and adults who are unable to compete for jobs that provide adequate pay and lead to careers with a future. In many instances, these persons suffer from limited or poor educational backgrounds or limited proficiency in English. Included in this group are a large number of ethnic minorities such as Native Americans, Blacks, and Hispanics. Other disadvantaged groups include migrants, persons in correctional institutions, and those from rurally isolated geographic areas.

The Department of Labor's August 1981 statistics indicate that minority teenagers have an unemployment rate of 45.7 percent, which represents 414,000 young people. The unemployment rate for black adult workers was a record 15 percent. Some minor part of this unemployment may reflect temporary economic conditions. However, for many unemployed young persons, it reflects lack of preparation for available employment opportunities which require a higher degree of skill than they have had the opportunity to acquire.

During school year 1979-80, the number of disadvantaged persons served under the Vocational Education Act was 2,038,943. In addition, the number of persons served having limited English proficiency (LEP) was 72,731. Unfortunately, these figures cannot be compared with those from earlier years because of the inconsistent reporting practices mentioned in the section on handicapped students. An additional 70,521 disadvantaged

students were served in 1979-80 with Special Disadvantaged funds under Section 140 of the Vocational Education Act. This section permits 100 percent funding of these special programs with Federal monies, although some State funds are also used. The 1979-80 enrollment figure under Section 140 is considerably lower than the 152,970 reported for the 1978-79 school year. However, this decrease may only reflect uncertainties in reporting procedures as well as problems experienced with this particular data element in the Vocational Education Data System.

Expenditures for disadvantaged students increased between 1978-79 and 1979-80. In 1979-80 \$474.4 million was spent to benefit the disadvantaged (Section 110), \$109.7 million Federal and \$364.7 State and local funds. This is a total increase of over \$57 million from 1978-79. Expenditures for LEP increased in 1979-80 to \$5.2 million Federal and \$20.3 million State and local funds, a total increase of \$4.2 million. (See Table 3 (p. 18)). Section 140, Special Disadvantaged expenditures, totaled over \$34.5 million in 1979-80. Federal expenditures amounted to over \$21.8 million of this total; and although the law does not require matching for these funds, the State and local contribution amounted to more than \$12.8 million. Overall expenditures for the Special Disadvantaged increased by \$4.8 million from 1978-79, almost all of which was Federal funds.

The Vocational Education Amendments of 1976 emphasize the mainstreaming of all students in regular classes. A number of States are using vocational education money for the disadvantaged to provide learning labs in which students can be given remedial assistance in the basic subjects of math and reading while enrolled in regular vocational education programs. Tutorial assistance is also provided in postsecondary institutions to help students keep pace with their peers in more technical subjects. Vocational education funds have supported these and other activities to help the disadvantaged obtain education and training for jobs with a future.

Table 3 Total Federal and State/local vocational education expenditures (including carryover funds) for handicapped, disadvantaged, and limited English proficiency (LEP) students under Section 110 (VEA), 1978-79 and 1979-80 school years, United States and Outlying Areas

School year	Total expenditures*	Federal	State/local
<u>Handicapped</u>			
1978-79	\$174,303,824	\$53,140,457 (30.5%)	\$121,163,367
1979-80	195,258,069	63,063,123 (32.3%)	132,194,946
<u>Disadvantaged</u>			
1978-79	416,993,085	104,954,394 (25.2%)	312,038,691
1979-80	474,429,777	109,747,915 (23.1%)	364,681,862
<u>Limited English proficient</u>			
1978-79	21,280,623	3,878,992 (18.2%)	17,401,631
1979-80	25,497,283	5,163,792 (20.3%)	20,333,491

\* All figures in this table cover excess costs for supplementary services, only. Beginning in 1978-79, only these monies were to be reported for national priority populations.

U.S. Department of Education, National Center for Education Statistics

#### Displaced Homemakers and Other Special Student Groups

The Vocational Education Act mandates the provision of special services for displaced homemakers and other special groups such as single heads-of-households, homemakers and part-time workers who wish to secure full-time jobs, and persons seeking jobs in nontraditional occupations.

According to the most recent (1979) data available from the Department of Labor, 11 million women are disadvantaged financially and in need of job skills. Of that 11 million, the data indicate that approximately 5 million are displaced homemakers--widowed, separated, or divorced. The Vocational Education Data System (VEDS) reported that over 42,000 displaced homemakers were served in vocational education during the 1979-80 school year.

According to a 1981 survey conducted by the National Displaced Homemakers Network, nearly 400 programs throughout the country provide counseling, workshops, skills training, and job placement assistance to displaced homemakers. These programs are situated at women's centers, YWCA's,

vocational technical schools, community and 4-year colleges and universities. Often, vocational education programs are coordinated with State and CETA funded projects and involve training in nontraditional occupations. Vocational training enables displaced homemakers and others to contribute to the economic revitalization of the country and to help address the critical shortage of skilled craft workers.

VEDS data show that vocational education expenditures for displaced homemakers decreased slightly from school year 1978-79. A total of \$10,079,507 was spent in school year 1979-80 as compared to \$11,794,551 in 1978-79. Federal funds comprised 31.1 percent of the total amount spent in 1979-80 as compared to 15.6 percent in 1978-79, since nonfederal funds decreased by \$3,012,967 in school year 1979-80.

Programs which provide displaced homemakers with education and training, equal access to jobs, and income maintenance have proved themselves to be viable routes from public dependency to self-sufficiency and economic independence.

#### Bilingual Vocational Students

Bilingual vocational training prepares persons with limited English proficiency to perform adequately in a work environment which requires English language skills. In fiscal year 1980 \$4.8 million in Federal funds were appropriated for this program, all of which was issued as discretionary grants by the Secretary. These funds were used for 15 bilingual vocational training projects for a total of \$3.1 million, 7 bilingual vocational instructor training projects for a total of \$1.2 million, and 2 instructional materials development projects for a total of \$403,000.

These 1981 projects provided specific vocational job skills to 1,372 unemployed and underemployed persons who spoke Spanish, Chinese, Indian, Korean, Asian, or other languages. Each trainee learned the skills in occupations such as dental assistant, chef, auto mechanic, electrician, or refrigerator repairer. In addition to teaching skills, the projects offered job counseling, job placement, and followup services.

The seven bilingual vocational instructor training projects prepared 268 teachers to qualify as instructors for such programs. These projects were conducted in local education agencies, institutions of higher education, private nonprofit vocational training institutions, and organizations and agencies that specifically serve persons whose native language is other than English. These instructor training projects helped both bilingual vocational instructors and teachers of job-related English as a second language to learn the skills they needed to develop their own bilingual vocational curricula and teaching techniques. Languages other than English in which the instructor-trainees were fluent included Spanish, Indian, Chinese, and Vietnamese, among others.

Of the two instructional materials development projects funded, one will identify occupations in which a foreign language is an asset; the other will determine successful strategies for using outside agencies for outreach services for bilingual vocational training programs.

According to the findings of a study by InterAmerica Research Associates, the job placement success rate for trainees in eight Federally funded projects ranged from 85 to 100 percent.

Annual independent evaluation reports indicated that an average of 95 percent of trainees complete their training. In addition, followup reports from project directors showed that trainees pay back the cost of their training through taxes within 1 to 3 years.

### Incarcerated Students

Another population group that has benefited from vocational education are inmates in correctional institutions. To help this group, a corrections program was established in the Department of Education in December 1980 in cooperation with the National Institute of Corrections (U.S. Department of Justice). The ED corrections program provides coordination and information services to the field of correctional education in order to increase the quality and quantity of academic, vocational, and basic skills programs for the Nation's 593,458 adult and juvenile prisoners.

The people served by this program have various degrees of educational, skill, and employability deficiencies. According to the National Institute of Corrections, approximately 61 percent of the prison population completed less than 12 grades of school; 32 percent of the incarcerated were unemployed at the time of arrest in 1981; 55 percent of inmates earned less than \$6,000 at the time of arrest in 1981; and 47 percent of the prison population in 1980 was black. Most vocational programs for incarcerated offenders are located in prison facilities rather than in community programs. In 1979-80 about 12 percent of the adult inmates were enrolled in vocational education. On the average, States spend 1.5 percent of their total correctional budget on inmate education and training programs.

A few efforts have been undertaken to study the effects of vocational education on the post-release success of ex-inmates. The National Center for Research in Vocational Education has reported the findings of several studies that suggest that, when inmates secure employment in a job for which they are trained, recidivism rates decrease. The data also suggest that inmate work assignments in semi-skilled maintenance or industry jobs result in lower recidivism rates than those with work assignments in unskilled jobs.

Although most of these surveys describe specific programs and do not constitute systematic research, the results suggest that vocational education plays a role in reducing recidivism.

### Equal Access Thrust

Equal access initiatives are a relatively new aspect of vocational education. The Vocational Education Act, as amended in 1976, authorized States to spend Federal funds to ensure equal access. The Act attempts to integrate equal-access concerns into every part of the vocational

education system. State sex equity coordinators, along with school administrators and faculty, students, parents, employers, and advocacy groups, have been working jointly to remove sex-biased barriers and to promote full participation of males and females in all vocational education programs.

Although total enrollment in vocational education decreased, female enrollment in vocational education increased during the 1979-80 school year. In 1978-79, female enrollments, excluding adult short-term students, were 50.80 percent of the total. In 1979-80, female enrollments were 51.56 percent of the enrollments identifiable by sex.

During the past 5 years, female enrollments in vocational education have not only been increasing, but changing as well. Females now represent over 51 percent of postsecondary and adult vocational education students. This growth has occurred partly because vocational educators have made a concerted effort to increase female enrollments, especially in nontraditional programs.

According to preliminary data for school year 1979-80, almost 37,000 women received support services at a cost of nearly \$2.4 million. Preliminary data for day care services shows that 3,762 students received these services, and expenditures totalled nearly \$1.6 million.

Although sex-equity programs at the State level vary in expenditures, audience, and results, all States reported Federal expenditures for full-time sex equity coordinators, and eight States also reported State and local expenditures for this purpose. These coordinators provide technical assistance, resource materials, and encouragement for local cooperation.

Table 4 (p. 22) shows the increase from 1977 to 1980 in the percent of female and male enrollments at all levels in vocational programs that have previously been underutilized by either sex.

In addition to direct expenditures for services to students, States have the option of using program improvement and supportive services funds (Section 130) on grants to overcome sex bias. In fiscal year 1981, 35 States planned to spend \$2,339,986 of these Federal funds on grants to overcome sex bias. In 1979-80, \$2.1 million Federal and \$1.8 million State and local funds were spent for this purpose.

The following examples show some of the creative ways by which States have promoted sex equity in vocational education.

- California - The "World of Apprenticeship" is California's film series contribution to sex equity. It includes presentations on operating engineers, the culinary trades, carpenters, and the automotive trades. California is one of the model States for developing cooperative programs between labor agencies and vocational education to recruit females into nontraditional occupations. They also have 600 trainers ready to conduct in-school workshops.

Maryland - Maryland has almost 40 percent female enrollment in postsecondary trade and industrial programs. The "New Directions for Women" center for displaced homemakers in Baltimore has provided services to over 4,000 women since 1976. As part of its comprehensive program, the center trains displaced homemakers to present sex equity workshops for high school students.

Missouri - This State received \$100,000 worth of free public service announcements on television and radio that featured vocational education projects geared to promote equal access. In addition, State priorities for projects encouraged nontraditional enrollments and included handbooks for recruiting females into trade and industrial programs and males into health occupations. Twenty local educational agencies received additional program funding as a result of increasing their nontraditional enrollments by at least 10 percent.

Special projects and products, such as those described above, have served as model programs to ensure equal access for both sexes to all vocational programs and activities.

Table 4 Percent of female and male vocational education enrollments in nontraditional programs, 1977-1980

<u>PROGRAM</u>	<u>FEMALE</u>			
	<u>1977</u>	<u>1978</u>	<u>1979*</u>	<u>1980**</u>
Agriculture	14.9	17.2	19.2	19.6
Distributive education	49.7	51.5	53.6	54.7
Technical education	17.0	17.6	19.4	21.1
Trade and industrial	14.4	15.4	17.5	18.5

<u>PROGRAM</u>	<u>MALE</u>			
	<u>1977</u>	<u>1978</u>	<u>1979</u>	<u>1980</u>
Consumer and homemaking	18.4	19.5	20.6	22.0
Occupational home economics	16.1	17.6	22.1	21.4
Office	24.9	24.4	26.5	26.3
Health	21.8	22.1	15.7	21.0

\* Does not include adult short-term enrollments.

\*\* Does not include 949,500 students whose sex was unreported.

U.S. Department of Education, Office of Vocational and Adult Education, and the National Center for Education Statistics

### Appalachia Program

The Appalachian Regional Commission (ARC), from its beginning in fiscal year 1965, concentrated its major education efforts on constructing and equipping facilities for vocational education. This concentration reflects the strategy of ARC to promote economic development in Appalachia by helping to provide a skilled work force. During the mid 1970's the program was expanded to include education demonstration projects.

In fiscal year 1981, 63 projects were funded in 11 States. Support for these projects included \$1.4 million in Federal vocational education funds, \$9.6 million in State and local money, and \$9.6 million from the ARC. Some projects served entire school districts while others served individual schools or programs. Ten schools received funds to build additions, which enabled them to serve an additional 2,800 students. The 53 demonstration projects served over 11,000 students.

One example of an ARC demonstration project is a program for curriculum improvement and training for skilled workforce needs in solar energy. This secondary program is operating in four high schools in the ARC region in North Carolina. In 1980 two additional schools in the North Carolina ARC region received consultant services. The purposes of the State-sponsored curriculum were to train students in installation, service, and maintenance of solar energy systems and energy efficient climate control systems, and to promote public awareness of energy conservation and efficiency.

One hundred and thirty-nine students were enrolled in this program during school year 1980-81. The two schools receiving consultant services enrolled an additional 66 students. Students were trained in solar energy through skills drawn from traditional vocational subjects, primarily heating, ventilation, and air conditioning. Students also constructed displays to educate the public and exhibited their works at the State Fair, a regional energy fair, and a community energy exposition. Over 600,000 people had an opportunity to view these exhibits and learn more about solar energy.

Public awareness of this project was greater than anticipated. Instructors served as solar energy resource persons for their communities and numerous calls for information were received. Instructors and students also helped to reduce energy consumption in their communities by performing energy audits on schools, churches, and private homes; by installing solar systems on school buildings; and by making efficiency adjustments of oil-fired generators in community buildings and churches. This demonstration project not only trained skilled workers but also developed curriculum materials and increased public awareness of solar energy.

The ARC program as a whole has involved local development districts in planning the area vocational school facilities and programs. This community involvement and support has contributed to program success by linking vocational education with the training needs of the community. The ARC program has helped reverse the out-migration of people and has helped to supply a trained work force which, in turn, has contributed to the overall economic improvement of the Appalachian Region.

## Programs for Indian Tribes and Indian Organizations

The Vocational Education Act provides programs for Indians through discretionary grants that are awarded to tribes and tribal organizations by the Secretary. During fiscal year 1981, 34 grants were awarded to tribal organizations in 15 States. These projects will be operated during fiscal year 1982. Total Federal funds amounted to nearly \$7 million.

More than 6,000 Indian youth and adults have participated in this vocational education program since it began in 1978. Students acquire skill training and career awareness, and receive counseling and placement services. Bilingual training in a variety of vocations is part of the program. In addition, instructors and project directors receive inservice training.

Indian youth and adults who receive supportive services and vocational skill training seek entry level jobs both on and off the reservations. The training they receive is focused on those jobs which are identified by tribal economic development planning as needed by the tribe. Vocational training thus provides skilled workers for existing jobs and also promotes entrepreneurship for those new enterprises needed for economic development of the reservation. Vocational education, by providing skilled workers, has been judged through national evaluations to be an effective tool for achieving the economic development which increases self determination for Indian tribes and tribal organizations. The program has also aided in promoting collaborative linkages between State education agencies and tribal organizations.

## VOCATIONAL STUDENT ORGANIZATIONS

In 1974 the U.S. Office of Education established a policy that recognized vocational student organization activities as an integral part of vocational instructional programs. This policy, revised to include the addition of the ninth vocational student organization (The National Postsecondary Agriculture Student Organization), was issued as follows by Secretary T.H. Bell on September 28, 1981:

"Policy Of The United States  
Department Of Education  
For Vocational Education Student  
Organizations

The United States Department of Education maintains a close relationship with nine vocational student organizations and welcomes their cooperation and support in strengthening programs of vocational education. Recognizing that the past performance and future potential of these nine organizations are compatible with the overall purposes and objectives of education today, the United States Department of Education strongly endorses their objectives and seeks to involve their thinking in the improvement of Vocational Education.

In view of this, these policies represent the position of the United States Department of Education.

1. The United States Department of Education recognizes the educational programs and philosophies embraced by the following vocational student organizations as being an integral part of vocational education instructional programs.

American Industrial Arts Student Association  
Distributive Education Clubs of America  
Future Business Leaders of America-Phi Beta Lambda  
Future Farmers of America  
Future Homemakers of America  
Health Occupations Students of America  
National Postsecondary Agriculture Student Organization  
Office Education Association  
Vocational Industrial Clubs of America

2. The United States Department of Education recognizes the concept of total student development as being necessary for all vocational education students to assume successful roles in society and to enter the labor market.
3. The United States Department of Education will provide technical and supportive services to assist vocational student organizations and State agencies in their efforts to improve the quality and relevance of instruction, develop student leadership, enhance citizenship responsibilities, overcome sex and race discrimination and stereotyping, and serve students of special populations.
4. The United States Department of Education recognizes the responsibility for vocational instructional programs and related activities, including vocational student organizations, rests with the State and local education agencies.
5. The United States Department of Education approves Federal and State grant funds for vocational education to be used by the States to give leadership and support to these vocational student organizations and activities directly related to established vocational education instructional programs at all levels under provisions of approved State plans for vocational education.

Efforts on the part of State and local education agencies to recognize and encourage the growth and development of these vocational student organizations are highly important and deserve the support of all leaders in American Education."

Vocational student organizations recognized by the Department of Education are:

<u>ORGANIZATION</u>	<u>STUDENT MEMBERSHIP (1980-81)</u>
<u>Agriculture</u>	
Future Farmers of America (FFA) .....	482,611
National Postsecondary Agriculture Student Organization (NPASO) .....	83,000
<u>Business, Office</u>	
Future Business Leaders of America (FBLA) .....	200,000
Office Education Association (OEA) .....	74,256
<u>Distributive Education</u>	
Distributive Education Clubs of America (DECA) .....	177,770
<u>Health Occupations</u>	
Health Occupations Students of America (HOSA)...	28,079
<u>Vocational Home Economics Education</u>	
Future Homemakers of America (FHA) and Home Economics and Related Occupations (HERO)...	393,253
<u>Industrial Arts</u>	
American Industrial Arts Student Association (AIASA) .....	21,665
<u>Trade and Industrial Education</u>	
Vocational Industrial Clubs of America (VICA)...	<u>260,687</u>
TOTAL .....	1,721,321

Vocational student organizations not only help secondary, postsecondary, and adult students to develop vocational competencies, but also leadership and communication skills. Special achievement programs are designed to motivate students, supplement the instructional programs, encourage leadership, and involve business, industry, and the public. Students are provided opportunities for growth and development in learning civic and citizenship responsibilities through participation in national initiatives of their respective organizations.

"Building Our American Communities" is one example of an achievement program of the Future Farmers of America (FFA). Future Homemakers of America and Home Economics and Related Occupations (FHA/HERO) chapters were involved in activities such as the Youth Employment Project, "Healthy Babies - Chance or Choice," conducted in cooperation with the March of Dimes, as well as drug/alcohol abuse projects, suicide prevention, and student nutrition projects.

The Distributive Education Clubs of America (DECA) promoted projects on civic consciousness, shoplifting prevention, free enterprise, and learn-and-earn. The Future Business Leaders of America (FBLA) sponsored

activities designed to increase economic awareness and foster the concepts of the free enterprise system with activities around the theme "In Touch with the Business of America."

The Office Education Association (OEA) sponsored hundreds of mentally retarded athletes to the Special Olympics summer games. The Health Occupations Students of America (HOSA) co-sponsored with the Health Insurance Institute many community awareness projects that encouraged chapters to plan and implement health-related projects to aid their communities in becoming more aware of current health issues.

In June 1981 The Vocational Industrial Clubs of America (VICA) held its 17th annual National Leadership Conference and United States Skill Olympics at the Georgia World Conference Center in Atlanta. Of the 7,000 delegates, contestants, advisors and technical committee members attending the event, 2,359 secondary and postsecondary students competed in 36 separate contests of occupational skill proficiency. In addition, this was the first year that VICA, the official United States' representative to the International Skill Olympics (since 1975), had hosted the international competition. Two hundred and seventy-four international contestants from 14 nations competed in 33 skill events.

All of these activities provided vocational students with "hands on" learning situations which enriched classroom instruction, promoted the transition from school to work, and resulted in greater community involvement.

#### TEACHERS

In the 1979-80 school year, there were 378,061 full-time and part-time teachers in publicly supported vocational education institutions in the 50 States and the District of Columbia. While this constitutes an apparent increase of almost 51,000 teachers compared to those reported for the 1978-79 school year for the United States and the Outlying areas, the Vocational Education Data System (VEDS) was being validated and modified when that year's data were being collected. Therefore, the actual difference between the 2 years is not known. Except for the 1978-79 school year, Chart C (p. 28) suggests that the trend since 1972 has been a steady increase. The situation in 1979-80 wherein more teachers are apparently being employed to train slightly fewer students (compared to 1978-79) is thought to have occurred because of the rapid increase of part-time instructors in postsecondary and adult programs.

Analysis of the VEDS data shows that postsecondary programs rely heavily on part-time instructors (52 percent of the total number). Because the secondary programs were believed to have so few part-time teachers, data on part-time teachers were not even collected at the secondary level. Because of the rapid growth in postsecondary vocational and technical education, there are now almost as many teachers in these institutions as in secondary programs (49 percent in 1979-80). Roughly an equal number of part-time instructors are added to postsecondary programs for each single full-time instructor. Many of the part-time staff continue to hold regular positions in private industry. This implies that any problem of insufficient preparation for these part-time persons will not be so much in the technical as in the pedagogical area.

## Teachers In Vocational Education (VEA)

THOUSANDS

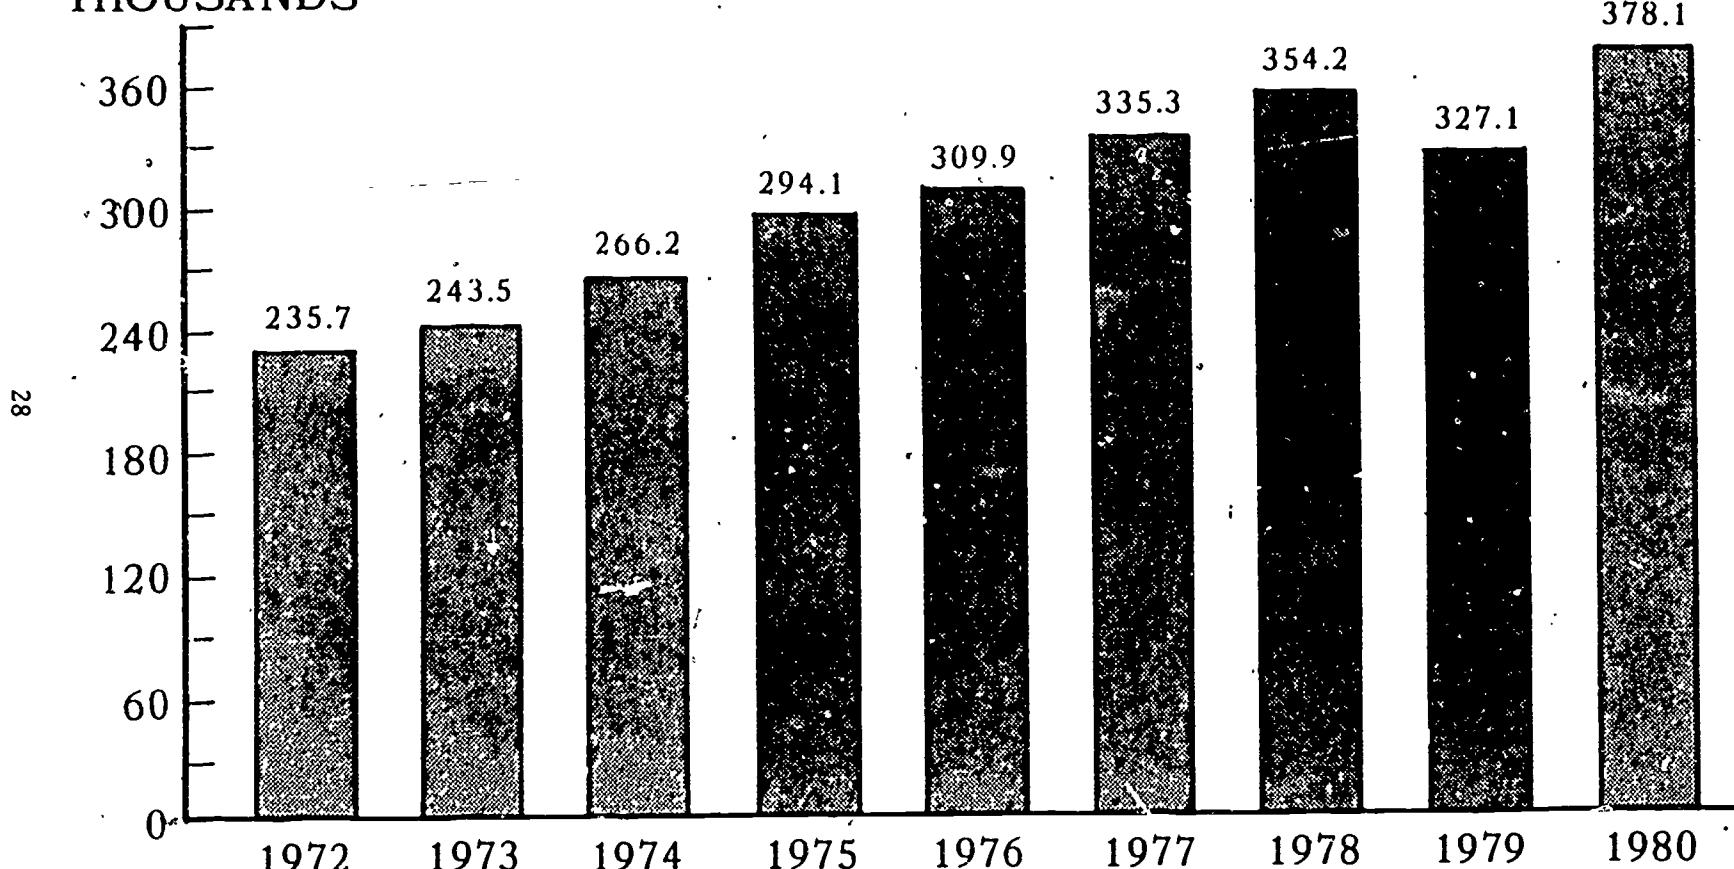

Chart C

37

The status of teachers at the secondary level is more complicated. While the annual turnover rate for vocational education is approximately in the 10-14 percent range, there are sharp differences between specific programs. For example, trade and industrial teachers tend to remain in teaching once they have had a few years' experience, while many vocational agriculture instructors reportedly leave the profession by age 30. Although vocational agriculture seems to have this special problem, the more common problem at the secondary level (especially in trade and industrial education) seems to involve updating the technical skills and knowledges of older instructors.

There are other teacher-related problems in vocational education. In the area of sex equity, a closer look at the VEDS tables reveals that female teachers are still concentrated in traditional fields such as office occupations, occupational home economics, consumer and homemaking, and health. Given the expected shortages that an expanding economy is projected to cause, more emphasis must be given to attracting females into nontraditional programs in trade and industrial education. In the area of teaching the handicapped, a recently completed Department of Education contract reveals that vocational instructors themselves feel that they need added skills in teaching these students. While no hard data are available, reports indicate similar problems involved with instruction of minorities and students with limited English proficiency, particularly Hispanic.

#### FACILITIES AND EQUIPMENT

Vocational education programs are offered in numerous types of institutions both public and private. The National Center for Education Statistics reported that there were 27,753 institutions that offered vocational education in school year 1978-79. This total includes programs in public, private, 2-year, 4-year, correspondence, and correctional facilities. The following table provides information on the numbers of schools in each category. Almost two-thirds of these institutions were at the secondary level and virtually all of the public secondary institutions offering vocational programs received Federal funds under the Vocational Education Act.

According to the National Center for Education Statistics, the receipt of Federal funds under the Act, at the postsecondary level, is variable depending on the type of institution. It is estimated that over three-fourths of the 2-year public institutions of higher education receive such funding, but only two-fifths of public noncollegiate postsecondary schools and less than one-third of State correctional facilities. Only about 5 percent of 4-year institutions of higher education receive such funding and virtually none of the private noncollegiate postsecondary schools or correspondence schools. However, it should be noted that eligible recipients under the Act (which prohibits direct distribution of VEA funds to private institutions) can buy instruction from proprietary institutions under contract arrangements. The Vocational Education Data Systems does not collect this kind of data.

Table 5 Number and percent of secondary and postsecondary institutions offering vocational education programs, by control and type of institution

Control and type of institution: 1978-79	Number	Percentage distribution
All institutions .....	27,753	100.0
Public comprehensive or vocational high schools ..	15,729	56.7
Public area vocational centers (secondary).....	1,395	5.0
Private secondary schools .....	586	2.1
Public noncollegiate postsecondary institutions...	812	2.9
Private noncollegiate postsecondary institutions..	6,813	24.6
Correspondence schools .....	83	0.3
2-year institutions of higher education .....	1,135	4.1
4-year institutions of higher education .....	647	2.3
State correctional facilities .....	553	2.0

U.S. Department of Education, National Center for Education Statistics, The Condition of Vocational Education, 1981

Construction expenditures in 1979-80 for area vocational schools, as defined by the Act, amounted to \$13.8 million in Federal funds and \$122.6 million in State and local funds. This is a decrease of \$27 million from 1978-79 and \$54 million from 1977-78. Although some new vocational schools have been constructed and equipped, the major portion of the 1979-80 expenditures was used to remodel, expand, and update existing facilities.

A National Study of Vocational Education Systems and Facilities, 1978, by the Department of Health, Education and Welfare, estimated that 64 percent of all institutions were in good condition with 24 percent needing minor maintenance. However, 21 percent of institutions in central cities with a metropolitan population over 100,000 needed major maintenance or replacement. Since expenditures for construction are decreasing rapidly, it seems unlikely that this situation will change much in the near future.

Equipment in vocational-technical schools generally has a life span of about 10 years. Modern technology, however, tends to outdate equipment long before that. Some school systems do manage to keep pace with modern technology by continuously updating their equipment. That some school systems are able to keep current with business and industry is largely due to the initiative of progressive local educators and the support of the private sector.

## PROGRAM IMPROVEMENT

Program improvement may be defined as any activity that is intended to increase the quality of any vocational education program component. These activities range from research, development, testing, and evaluation through personnel development. While they may occur singly at any governmental level, most involve a partnership between the State and Federal levels. Experience has proved that products and approaches which are both practical and systematically diffused into local instructional programs have a strongly positive impact on the quality of vocational education.

### State Board Evaluation

In fiscal year 1980, all States conducted some level of evaluation of their vocational education programs as required by the Vocational Education Act. A review of the 1980 accountability reports was conducted to determine the impact of State evaluations on programs. Out of 40 States involved, 35 used evaluation results for improving vocational education instruction, support services, planning, and access. Improvements were also made in the following areas: research; exemplary programs; curriculum; vocational education personnel development; inservice teacher training; and teacher certification/qualification.

Thirty-two States used evaluation results to improve instruction. Examples of revisions included: improving student/teacher ratios; remodeling classrooms and shops; enlarging facilities; buying new equipment; rearranging equipment for safety; updating lesson plans; providing competency based instruction; developing and improving use of vocational student organizations; and improving use of employers in the classroom as resource persons.

Thirty States improved support services by using evaluation results. Typically, improvements occurred in the following services: guidance and counseling; placement; followup; recruitment; and admissions.

Thirty-eight States used evaluation results to improve program planning. Examples of changes in planning included: better articulation between secondary and postsecondary programs; expansion and redirection of programs; revisions of local applications; better data collection and analysis; improvement of long-range planning; improvement of coordination between education, business, and industry; examination of evaluation procedures; establishment of local advisory councils; and revising goals and objectives.

Twenty-eight States improved access through the use of evaluation results. Examples of actions which occurred included: inservice training for teachers to enable them to better serve special needs students; addition of special projects for disadvantaged and handicapped students; increased enrollments of handicapped and nontraditional students; revisions in programs for students with limited English proficiency; and improvements in programs to improve sex-equity and serve the needs of displaced homemakers.

Although all States have conducted evaluations and used the results to improve their programs, many States have had difficulty in meeting the complex requirements of the regulations. Some States, of course, have been more successful than others. In addition, on-site reviews have shown that several States have more extensive evaluation systems than their accountability reports indicate. This suggests that there may be a reporting burden in addition to the complexity of the evaluation requirements themselves. Both of these problems may be alleviated when the deregulation efforts of the Department are completed.

#### State Research Coordinating Unit Projects

The Vocational Education Act authorizes States to fund activities and projects which will improve vocational education programs. State program improvement activities include research, exemplary and innovative programs, and curriculum development.

In school year 1980-81 States used approximately \$24.6 million in Federal funds to conduct 899 State program improvement projects. This is an increase from 796 projects and \$21.9 million in 1979-80. Educational agencies received over 87 percent of the funding, with 4-year colleges and universities receiving the largest share (39 percent). Noneducational agencies (research centers, private businesses, public agencies, and individuals) received the remaining 12.3 percent of the funding. Although State program improvement projects have focused on every educational level, over 47 percent have been at the postsecondary and combined high school and postsecondary level.

Over 36 percent of the funds were used for curriculum development, resulting in more than 250 separate products. The second largest use of funds (12.6 percent) served special needs students such as the handicapped, gifted, and disadvantaged. Other projects addressed dissemination; career development; evaluation; school, community, industry linkage; teacher education; and sex equity. Other outcomes and products, in addition to curriculum, included 97 training programs and workshops, 94 career and vocational counseling projects, 62 inservice education projects, and 10 placement and employment services projects.

Collectively, the States are supporting research, exemplary programs, and curriculum development at about equal levels, but there is a wide range in project size within and among States. Some States chose to fund no projects in certain categories. The amount obligated for each project also varies considerably. The average funding per project is \$27,336 with actual figures ranging from \$487 to \$466,419. These variations indicate the wide range of strategies chosen by States to achieve program improvement goals.

#### State Personnel Development

Another activity that is designed to improve programs is State-administered vocational education personnel development. States may use funds to support programs or projects designed to improve the

qualifications of those serving or preparing to serve in vocational education programs, including teachers, administrators, supervisors, and vocational guidance and counseling personnel. Although data are not available on the number of personnel trained during a given fiscal year, the potential population for service through these State program improvement and supportive services activities includes over 400,000 vocational education teachers, supervisors, administrators, teacher educators, and other support personnel. (See the preceding section, p. 27 for more information on teachers.)

The National Center for Education Statistics, Vocational Education Data Systems (NCES/VEDS), reported total Federal outlays for preservice and inservice training, under Section 135 of the Vocational Education Act, increased 51.1 percent: from \$9 million in 1977-78 to \$13.6 million in 1978-79. In school year 1979-80, States spent over \$48.2 million (\$23.2 million Federal and \$25 million State and local funds) on preservice and inservice training. This is a total increase of \$2.4 million from 1978-79.

In 1978 there was a State system for personnel development in most States and a vocational education personnel development coordinator in every State and Territory. These coordinators were responsible for encouraging, assisting, and coordinating preservice and inservice personnel development across all occupational areas at all levels. In October of 1981, there were only 19 States with full-time personnel development coordinators. In most other States that function has been assigned to the Research Coordinating Unit (RCU) director or another State administrator. A 1981 survey of the 57 RCU directors, completed by the National Research Coordinating Unit Association, indicated that responsibility for personnel development was a part of the RCU in 31, or 54 percent, of the 57 States and Territories.

During 1980 and 1981, on-site quality reviews of State program improvement and supportive services were conducted in seven States: Arizona, Colorado, Mississippi, Nebraska, Texas, Virginia, and Washington. These quality reviews included the State's personnel development activities. Arizona achieves personnel development coordination through a contract with a major vocational teacher training institution that maintains close liaison with the State's RCU. Mississippi and Texas conduct personnel development activities under the auspices of the RCU. Virginia has a strong, statewide personnel development system, as does Nebraska, both of which are coordinated with the RCU's. The Colorado RCU funds the personnel development in that State. Washington's funds for personnel development are split by full-time equivalent enrollment between secondary school and community college staff. These on-site management evaluation reviews for program quality indicate that essential and effective personnel training is taking place in those States.

#### Programs of National Significance

Improving the quality of vocational education is not only a State concern, but a major ED concern also. Program improvement is the major purpose of the discretionary Programs of National Significance in Vocational

Education. Under the Secretary's direction, program improvement needs of national importance are addressed through competitively awarded contracts. In fiscal year 1981, \$10 million was appropriated for these activities. These funds supported the National Center for Research in Vocational Education, the National Occupational Information Coordinating Committee (discussed on p. 38), and six regional Curriculum Coordination Centers. In addition during 1981, 36 discretionary projects were continued from prior years and 6 new projects were funded.

These projects focused on developing competency measures for vocational skill areas, serving older persons in vocational education, converting military curriculum to civilian use, and many other areas. One noteworthy project focused on Industry-Education-Labor Collaboration which promoted linking the interests and energies of these institutions. Interests common to all three groups include: occupational information; career guidance and counseling; skill development; work and service experience; community economic development and job creation; and concern for the ways all sectors can work together to develop more rewarding-learning and work opportunities for all citizens. As a result of this project, many State departments of education have appointed I-E-L coordinators to assist communities in these efforts.

#### National Center for Research in Vocational Education

The National Center for Research in Vocational Education (NCRVE) provides vocational education research and development which address problems of national significance. It also acts as a clearinghouse, distributes program improvement products and information, and provides information for use in national planning. During fiscal year 1981, the National Center received over 5,600 requests for such information. These functions, and all other National Center undertakings, are directed towards increasing knowledge about vocational education and improving its programs and personnel.

In fiscal year 1981, the Center was supported with approximately \$5.5 million in Federal funds. During this fourth year of the Center's contract with the Department, it delivered more than 150 products. For example, a series of three reports was developed based on school transcript and interview data from the 1979 and 1980 National Longitudinal Survey New Youth Cohort. The first report of the series was "Patterns of Participation in Secondary Vocational Education." By using the transcript data, the National Center developed more precise and descriptive curriculum classification measures.

The second report, "Employment Experiences of Students with Varying Participation in Secondary Vocational Education," used the specifications developed in the first report to estimate the effects of high school curriculum on the labor market experiences of youth. The study found that some concentrated involvement in vocational education is significantly more likely to be associated with employment in realistic or conventional jobs than is incidental participation or no participation at all. Incidental participation or non-participation in vocational education contributes strongly to being out of the labor force.

The third report is titled, "Postsecondary Experiences of Students with Varying Participation in Secondary Vocational Education." This report states that a majority of high school graduates, both vocational and nonvocational, enroll in some type of postsecondary program. There was no significant pattern that suggested that more intensive vocational preparation was systematically associated with reduced levels of postsecondary attendance.

As another part of its program improvement efforts, the National Center has a Dissemination and Utilization System Product Selection program. During the first 4 years of the contract, the Center systematically screened over 15,737 products developed throughout the country. Of these 15,737 products, 333 were identified and publicized for their potential impact on priority problems, and 25 were selected for nationwide dissemination and use. These selected products have been requested by all States for specific use.

The Center has two other improvement programs which are directed toward individuals' need for professional development. One program, the Advanced Study Center, provided professional growth opportunities for qualified men and women to engage in productive inquiry on a problem of national significance in vocational education. Fellows at the Study Center participated in numerous seminars, conferences, and workshops. The second program is the National Academy's In-residence Program. This program prepared 36 fellows to deal effectively with issues in preparing youth and adults for jobs. The National Academy conducted 80 leadership development programs in 28 States for 2,700 participants.

#### Curriculum Coordination Centers

The six regional Curriculum Coordination Centers provide a system for sharing development and dissemination of curriculum and instructional materials. Information sharing through dissemination and diffusion, technical assistance, and inservice training are emphasized. In fiscal year 1981, the Centers received approximately \$580,000 from the Vocational Education Act to accomplish their goals.

Activities and accomplishments of the six Centers for the period from January 1 - December 31, 1980 included the following:

- o Nearly 80,000 communications were sent to States advertising the availability of curriculum information.
- o States saved approximately \$4 million by adopting or adapting Center-identified materials.
- o 765 products were adopted or adapted by States.
- o More than over 2,700 information searches were conducted by staff of the Centers

- o 14,500 people participated in inservice workshops.
- c More than 391,000 items were disseminated to States and over 224,400 people were reached.

## STATE AND LOCAL ADMINISTRATION

### Expenditures and Uses

Vocational education is administered through a wide variety of State, Territorial, and local agency governance structures, delivery systems, and funding mechanisms. Each State and Territory is virtually unique in its administrative structure. These were the findings of an ED study, National Study of Vocational Education Systems and Facilities, conducted by Institutional Development Associates, Inc., and Westat, Inc. (1978).

To support state-level administration of vocational education programs, States expended a total of \$104.9 million (\$43.4 million in Federal funds (41 percent) and \$61.5 million in State funds (59 percent)) in 1979-80. This is an overall increase of \$9.1 million from 1978-79, although the share borne by Federal funds decreased by \$800,000. These funds were used for planning, technical assistance, data collection, evaluation, and dissemination activities involved in the States' programs of public vocational education.

For local-level administration, States spent a total of \$32.8 million (\$9 million in Federal funds (3 percent) and \$333.8 million in State and local funds (97 percent)) in 1979-80. This is an overall increase of \$80.8 million from 1978-79. Since the expenditures of Federal funds increased by only \$600,000, almost all of this increase was State and local funds. Local administration funds were used almost exclusively for salaries of staff who directly administered and supervised local vocational education programs.

School year 1979-80 was the first year in which special planning funds were available for State expenditure under Section 102(d) of the Vocational Education Act. States spent a total of \$2.6 million in Federal funds, and although these funds do not need to be matched, States also spent \$398,000 of their own funds for these special purposes.

These planning funds were used by a number of States primarily to improve their data collection systems, while other States upgraded their management information systems by obtaining more accurate and complete data on labor supply and demand, target groups, training opportunities, enrollments, and vocational education needs. Some evaluation activities were also supported with these new Federal funds.

### State and Local Advisory Councils

State Advisory Councils on Vocational Education (SAVCE's) and Local Advisory Councils on Vocational Education (LACVE's) were established for the purpose of aiding in the State and local administration of

vocational education programs. SACVE's and LACVE's are operating in every State, and their function is to advise State and local education agencies on the operation of vocational education programs.

State advisory councils also are intended to provide assistance by addressing the issues required by law, and by focusing on special needs within their own States. SACVE's are required to assess the effectiveness of vocational education programs, services, and activities. Many councils conducted their own studies, and others reviewed the results of the States' evaluations. The most frequent suggestions made by the councils to increase the effectiveness of vocational education were:

- o Improve vocational education-to-work linkages.
- o Guarantee equal access to men and women.
- o Improve coordination with CETA.
- o Upgrade inservice teacher training.
- o Replace and upgrade equipment.

State advisory councils are also required by the Vocational Education Act to review the distribution of Federal funds within a State according to the annual plan and accountability report. The councils have reported mixed effects of the distribution of the Federal funds. In one State the larger schools benefited because of larger enrolments, and in another State the smaller schools benefited because of reduced ability to pay. In another instance, the set-aside funds for the handicapped and disadvantaged were allocated in such small amounts that local impact was minor and difficult to measure. The councils that reviewed the distribution of Federal funds did find, however, that the distribution procedures were "in compliance" with the law.

A special concern addressed by over half of the State advisory councils focused on the needs of local advisory councils. Two issues were raised frequently. First, SACVE's alleged that LACVE's were not being consulted widely enough when local plans were formed. Second, SACVE's suggested that State administrators provide more support and guidance to LACVE's. While problems with LACVE's may be common, it is noted that there are other local advisory bodies, such as craft committees, which have long been integral parts of the vocational education system.

As required by the Vocational Education Act, States have insured that all agencies providing vocational education have established LACVE's. Many LACVE's have been active in developing local applications, in providing local and regional labor market information, and in updating programs, curriculum, equipment, and facilities. Some LACVE's are providing additional assistance by evaluating current vocational programs and services, by developing placement opportunities for completers, by examining various purchasing arrangements, and by undertaking promotional activities on behalf of vocational education.

## OCCUPATIONAL INFORMATION

Another mechanism for improving the planning and administration of vocational education is the National Occupational Information Coordinating Committee (NOICC) and the State counterparts, State Occupational Information Coordinating Committees (SOICC's). In fiscal year 1981, ED contributed \$3 million to NOICC and the U.S. Department of Labor contributed \$5 million. SOICC's received most of their funding from NOICC, but they also received funds from the State Boards of Vocational Education and CETA.

A major objective of NOICC and SOICC's has been the development and use of an Occupational Information System (OIS) in each State. By the end of fiscal year 1981, 50 States and the District of Columbia had implemented such systems. The OIS's assisted State and local administrators to plan instructional programs that better meet labor market needs. The OIS's also helped teachers, counselors and students determine occupational career goals.

To assist SOICC's in developing statewide Occupational Information Systems, NOICC funded the development of a publication entitled Vocational Preparation and Occupations, (VPO). This publication describes five major occupational classification systems and shows the correlation of data collected under one system against data collected under the other systems. NOICC staff is working with ED staff to develop VPO training materials, and will conduct training sessions on how to use this publication to improve occupational data collection.

NOICC has responded to the mandate to give special attention to the labor market information needs of youth and adults by funding Career Information Delivery Systems (CIDS). CIDS are also the second largest category of SOICC expenditures. By using data from the State's Occupational Information System, CIDS have made occupational and education information available to persons who are making career choices and searching for jobs.

NOICC has also promoted coordination and communication between Federal programs that provide occupational information and training opportunities for target populations. To exchange information with SOICC's and other State and Federal agencies, NOICC disseminated a memorandum series, conducted symposia for Federal officials, and convened special task forces and resource panels. SOICC's also provided information and training to data users to encourage the use of their occupational information.

In fiscal year 1981, as in previous years, NOICC and the State committees brought together widely separated data collecting systems for improved planning of vocational education.

## COMPLIANCE AND QUALITY OF STATE VOCATIONAL EDUCATION PROGRAMS

Fiscal year 1981 was the fourth year during which Management Evaluation Reviews for Compliance/Quality (MERC/Q's) were conducted in States that received Federal funds under the Vocational Education Act. Ten States were reviewed during fiscal year 1981 for State activities conducted during the 1979-80 school year:

Illinois	(10/80)	Texas	(4/81)
Arizona	(11/80)	Nebraska	(5/81)
Virginia	(12/80)	Maine	(6/81)
Mississippi	(1/81)	Colorado	(7/81)
Washington	(2/81)	Puerto Rico	(9/81)

These reviews assessed the extent to which States followed their approved operational plans, determined the degree to which their procedures and practices complied with existing laws and relevant regulations, and gauged the quality of these procedures and practices.

The compliance portion of the review focused on fiscal management, personnel and organization, planning, local program evaluation, program purposes, facilities, and advisory councils. Analysis of this portion shows that, for the great majority of the regulations reviewed, the States were in compliance. The most frequent problem areas were the funds distribution procedures, the setaside for students with limited English proficiency, the disadvantaged setaside, and local maintenance of effort. As part of the on-site review, States were provided technical assistance to improve their procedures, as needed.

The compliance portion of the MERC/Q system was computerized in fiscal year 1981, and proved to be a success. The States found the new approach to be helpful in preparing for the on-site review, and the MERC/Q team compiled a wealth of data and generated useful analyses which were previously impracticable. Information on the entire MERC/Q history is now stored in the computer.

The quality portion of the MERC/Q review focused on planning procedures, evaluation and student followup, and program improvement activities. The most common recommendation for all three areas was the need to improve coordination of services among related agencies and to make better use of available data and information so as to enhance program quality.

Although the Management Evaluation Reviews for Compliance/Quality were successful in determining that States were in compliance with the legislation, the reviews did not always provide enough technical assistance to the States to help them improve their procedures. To address the States' increased need for technical assistance, the MERC/Q's have been replaced with a Management Assistance Program (MAP). The MAP will help States identify their need for technical assistance in several administrative and programmatic areas. The major focus of the MAP will be on problem solving, helping States identify present problems in order to improve future performance.

## AUDIT RESOLUTION

In general, most States used their Federal Vocational Education Act allocations according to the requirements of that law. When problems were identified, they were usually corrected before the Office of Vocational and Adult Education received the final audit report. Only 14 audit reports involving 13 States were received in 1981. Five of these audit reports did not involve the possible return of any funds to the Federal government. In the remaining nine reports, auditors questioned the use of Federal monies totaling \$22 million. The Office of Vocational and Adult Education concurred in findings that totaled \$5.7 million. Ten of the audits were resolved during 1981 and four were being held pending completion of the review process or awaiting a response from the State agency involved.

A common finding in several audits was the failure to properly use funds within the carryover period as required by the Tydings Amendment. Two States have appealed their audit reports to the Education Appeal Board. One State has requested partial recovery (reinstatement) of the funds they returned as permitted by Part E of the General Education Provisions Act (GEPA).

II IMPACT OF VOCATIONAL EDUCATION ON NATIONAL NEEDS

Two national problems receiving maximum attention from the Administration are (1) revitalizing the Nation's economy and (2) improving defense preparedness. Another more recent initiative involves the economic restoration of inner cities through designation of special "enterprise zones." Although the methods proposed for addressing these national needs emphasize budgetary or tax-incentive initiatives, vocational educators are acting on the premise that skilled workforce development will prove to be a crucial weapon in any successful, long-term response to these and other national needs.

While there are many public and private mechanisms for conducting skilled workforce development, the public vocational education system is a most significant resource. This public system contains 19,071 institutions offering specialized vocational instruction, such as vocational high schools, area vocational centers, comprehensive high schools, 2-year technical institutes and community colleges, and non-collegiate postsecondary institutions. This publicly funded system represents a capital investment of many billions of dollars in facilities and equipment, and an aggregate annual operating budget of \$6.8 billion (only one-tenth of which was Federal Vocational Education Act money during the 1979-80 school year).

State vocational education systems are currently offering programs addressing national needs. Much of this movement has occurred during school year 1980-81, a year during which support for vocational education increased only marginally. In some States, State and local financial support decreased. According to informal reports, such States have been able to address major national needs by diverting funds from other programs, delaying plant and equipment modernization, tightening administrative structures, and collaborating more effectively with private business and industry.

Comprehensive national data on vocational education projects that specifically address national needs are not available through the Vocational Education Data System (VEDS) in any form that relates directly to these needs. Studies that might fill this data gap were only in the discussion stage this past year. Nevertheless, no report of vocational education's accomplishments during the 1980-81 school year would be complete without some concrete examples of vocational education's response to national needs. While not definitive, the following examples may serve to indicate vocational education's potential for the future.

#### ECONOMIC REVITALIZATION

##### The National Need

The Nation's economy no longer enjoys the overall dominant position, in either domestic or world markets, that it did during the three decades following World War II. There are multiple causes for our falling productivity rate, which now lags behind that of all but a few of the world's industrialized countries.

Skilled workforce development is one method to increase productivity for economic revitalization. While the private sector carries the major

responsibility for skilled workforce development, most firms cannot meet this responsibility -- and remain economically competitive -- without using the services of publicly funded vocational education. Vocational education trains new entry-level employees and retrains existing employees whose skills need updating. Other support services such as curriculum development and even trainee recruitment are also supplied by vocational education institutions.

In 1981 the National Center for Research in Vocational Education at the Ohio State University conducted a survey of 2,000 National Association of Manufacturers member firms. Over 50 percent of the respondents indicated that their company benefited from vocational education. Almost 40 percent felt that vocational education lowered their company's training costs; and 60 percent said that vocational education graduates needed less training than other new employees in similar positions. Eighty-five percent preferred hiring vocational graduates for jobs requiring less than a baccalaureate degree. It should be noted that these percentages would probably be higher if only those firms having had joint-program experience with vocational education were counted. Those companies currently involved in such joint efforts with vocational education graded its effectiveness more highly than those that had no such experience.

#### Vocational Education's Response

Vocational education contributes to economic revitalization by graduating a consistent flow of skilled, entry-level workers from its regular secondary and postsecondary "day school" programs. In addition, several other programs focus on adult training or retraining, and offer flexible solutions to the difficult problems characteristic of an economy in transition.

One type of vocational education program that serves economic revitalization retrains unemployed workers for new occupations. For example, when United States Steel Corporation phased out its mill in Waukegan, Illinois, the last workers to be laid off in October 1980 were senior craftspeople and skilled office workers with 18-30 years experience. Fifty-one of these workers attended courses at the Lake County Area Vocational Center. Nine more attended the Lake County Community College. Trainees at both institutions studied skills for which there was a proven demand: air conditioning, refrigeration and heating, small engine repair and others. Completers received either an associate degree or a special certificate of completion. By the end of 1981, most of the trainees had been placed in jobs in a new career field.

Another problem situation that vocational education can help solve is occurring in States where the secondary school enrollment is shrinking and some type of statutory tax limitation has been adopted. Many skilled teachers, particularly those at the elementary school level, must be released. The Commonwealth of Massachusetts is a prime example. However during 1981, the Massachusetts regional community college system began what has proved to be a spectacularly successful program. Released teachers were retrained as computer programmers and analysts through special vocational programs at the community colleges, and are now in a solid career field which has worker shortages throughout the Nation.

Another type of program to which vocational education contributes is apprenticeship training. This program is particularly important in fields such as the machine tools trades, where training is lengthy, companies are typically small, and the shortage of skilled workers is especially severe. A recent study by a group of industry associations places this worker shortage at 250,000 machinists during the next 5 years. A current example of apprenticeship training involves the Livingston-Wilbur corporation in Fanwood, New Jersey, a small firm which employs 45 workers. After unsuccessfully conducting a high-powered radio and newspaper recruitment campaign for skilled workers, the company solved its problem through a joint apprenticeship program with the area vocational center.

One of the more dramatic economic revitalization services provided by vocational education is the offering of customized, "quick-start" training for business and industry new to an area. According to a recently conducted survey, 21 States reported that their vocational education institutions had trained more than 100,000 persons in such "quick-start" programs during the 1980-81 school year. While data on the movement of existing industry from one State to another is largely lacking, it should be noted that the availability of a skilled workforce may enable new firms to be created in a State. This is important for economic revitalization, since new, small firms supply the majority of job openings in most industries.

South Carolina has an impressive record of attracting new firms through its modern system of "Technical Education Colleges." Significantly, South Carolina also reports that the customized training programs created at these institutions helped persuade scores of overseas firms to open branch offices and plants in the State. Many other States have made similar gains. Customized training has thus helped achieve a net gain in jobs nationally, rather than merely causing jobs to be switched from one State or community to another.

One of the better examples of the impact of customized training is Illinois' High Impact Training Services (HITS) program. This program not only meets specific training needs of new businesses and industrial firms locating in Illinois, but it also meets the needs of established firms that are expanding or making significant changes because of the introduction of new materials, product lines, equipment, and processes. The HITS program is coordinated through the Illinois State Board of Education in consortium with the Illinois Department of Commerce and Community Affairs, the Illinois State Chamber of Commerce, local educational agencies, community groups, and employers.

In fiscal year 1981, the Illinois State Board negotiated funding agreements with 15 community colleges, 2 area vocational education centers, and 3 local school districts. These schools provided 26 short-term training programs that helped 1,159 persons become employed. Based on the Illinois State Chamber of Commerce's own analysis, "What 100 Extra Jobs Mean to a Community," the employment of HITS trainees is projected to have produced the following aggregate benefits for the host communities, the State, and the Nation:

Additional households in communities	1,115
Additional residents in communities	4,067
Other persons employed in communities	788
Projected increases in revenues (FY 1982)	
Personal income	\$ 24,703,460
Bank deposits	11,432,500
Retail sales	15,145,394
Property taxes (7%)	973,023
Local sales taxes (1%)	151,454
State sales taxes (4%)	605,815
Federal income taxes (13+%)	3,211,437
State income taxes (2.5%)	617,584
	<hr/>
	\$ 56,840,667

The fiscal year 1981 investment made by the Illinois State Board of Education to achieve these benefits was \$740,385, or an average of \$638.81 per person. This added investment was only necessary to cover instructional costs, since facilities and equipment were already in place in existing vocational education institutions. Further, these results measure neither benefits accruing to employees nor the consequences of avoiding welfare payments for at least some of the trainees. However, these results emphasize that economic revitalization affects not only the private sector, but communities, local governments, and the State as well.

Because of the national focus on economic revitalization, the Assistant Secretary for Vocational and Adult Education appointed a task force in 1981 to explore and create new ties between education and the private sector to improve skilled workforce development. Two of the task force goals are to provide the private sector with greater operational responsibility for programs, and to promote increased financial support for vocational education from private sources. New mechanisms which include the private sector in managing training programs, such as public-private corporations, can have a great impact on economic revitalization by rebuilding inner cities and reaching more prospective trainees. In addition, planning began in 1981 to create an independent national council to address task force goals. Subsequently, regional and city councils will evolve to continue this effort toward economic revitalization.

Another initiative of the Office of Vocational and Adult Education during 1981 was a study funded under contract with the American Vocational Association entitled Vocational Education for Economic Development. The major study product, "Vocational Educators' Handbook for Economic Development," has been widely distributed. This handbook outlines workable techniques that many States have used to help achieve effective economic development programs through skilled workforce development, and includes case studies of model sites across the Nation where such techniques have been successfully implemented.

## DEFENSE PREPAREDNESS

### The National Need

Because of the predominant consensus that the Nation's defense preparedness posture has been allowed to deteriorate over the past decade, this Administration has developed plans to expend approximately \$1.5 trillion during the next 5 years to correct this weakness. There are two parts of this multi-dimensioned effort that involve skill training: first, insuring a sufficient number of civilian workers to build the necessary systems; and, second, insuring a steady supply of skilled military personnel to operate, maintain, and repair these systems.

Regarding a skilled civilian workforce, the need is a specialized segment of the overall need for skilled workers required for economic revitalization. According to recent projections by the Department of Defense, there will be a need for 10 million new workers within the next 5 years in 41 occupational fields that (a) span both defense and non-defense industries, and (b) require vocational training. This same study attempted to isolate that part of the need directly related to defense production. For example, total employment for electrical and electronic technicians is projected as rising from 204,440 in 1982 to 241,190 in 1987, or an annual increase of 3 percent without counting replacement needs. At the same time, as part of this total increase, the job openings for these technicians in defense-related industries are expected to rise from 50,770 in 1982 to 60,710 in 1987, or an annual increase of almost 4 percent again without counting replacements. In many key occupations (e.g., machinists), the annual growth rate in defense-related industries is expected to be twice that in all industries.

While it is hoped that the private sector will cover the many expected shortfalls in skilled workers for the defense industrial base, both the Defense Science Board of the Department of Defense and the House Armed Services Committee conclude that severe problems will be encountered, particularly by secondary and tertiary sub-contractors. If this occurs, inflation will be refueled as competition for skilled workers drives up labor costs; and, still more companies will be forced to import foreign workers.

Regarding skilled military personnel, the need results from the still-rapid loss of highly skilled technicians to high-bidding civilian firms (e.g., in the computer and nuclear energy fields). This loss means that skilled replacements must be rapidly trained, thus placing great pressure on the armed services' excellent training facilities for service jobs that have counterpart occupations in the civilian sector.

### Vocational Education's Response

Typical of vocational education's response to specific needs are the following:

- o The Mississippi Department of Education last year concluded its 10th year of training skilled craftworkers, welders, and shipfitters for the Ingalls Shipbuilding Corporation in

Pascagoula, Mississippi. Twenty full-time instructors work at the shipbuilder's site to train company employees.

- o Using privately donated equipment and combined public-private instructional staffs, six vocational high schools in the Sunnyvale, California area established special programs to train computer and electronics technicians for the Lockheed Missiles and Space Company.
- o Last year, the Secretary of Education's Region I Award for Excellence was presented to the Maine Bureau of Vocational Education for its "Pratt & Whitney Industrial Training Project." This project, ending in June 1981, trained 708 Pratt & Whitney Aircraft Group employees in the operation of production grinding machines, milling machines, horizontal lathes, and vertical turret lathes. In offering more than 118,000 training hours, State technical institute instructional staff were used exclusively; and the State of Maine contributed \$330,000, as well as \$50,000 of Vocational Education Act monies at its disposal. Employees and management have been well satisfied with the quality of training and retention and productivity have been excellent. The company has an \$18 million local payroll and preferentially uses local suppliers for \$35 million of orders annually.

Regarding the skill training of personnel in the military services, one of the more outstanding examples is a \$13 million contract between the United States Navy and a consortium of four postsecondary technical institutions: Lake County Community College, Great Lakes, Illinois; Meridian Junior College, Meridian, Mississippi; San Diego Community College, San Diego, California; and, the State Technical Institute, Memphis, Tennessee. All programs train active-duty naval air technicians. The largest program, budgeted in 1981 for \$7 million, is located at the State Technical Institute at Memphis. In 1981, this program trained: 15,000 in the fundamentals of aviation mechanics; 9,000 in basic electricity and electronics; nearly 1,700 aircraft technicians; 1,135 jet test mechanics; and 850 air traffic controllers.

Because of the critical nature of defense preparedness, the Assistant Secretary for Vocational and Adult Education, during 1981, appointed a task force to work with the Department of Defense and other Federal agencies to determine needs for skilled workforce development; and to develop mechanisms for focusing vocational education's proven capabilities on this task. A program handbook for local directors of vocational education is being developed and a national advisory panel of private industrialists is being formed.

## HIGH TECHNOLOGY

### The National Need

Underlying both the need for economic revitalization and the need to augment defense preparedness are the rapid advances in various technologies and the emergence of completely new technologies. The

ultimate solution to the Nation's low productivity may be to move industrial investment into high-technology fields such as telecommunications, microprocessors, robotics, biotechnology, and synthetic materials, among others. This implies not only major expenditures in new machines and processes, but also a parallel commitment to training the highly skilled workers needed to operate and repair this equipment.

A recent study by the National Center for Research in Vocational Education at the Ohio State University points out, "The development and production phase of the advanced technologies is outstripping the availability of a trained workforce to operate and maintain them. One example of this skill-shortage dilemma is the rapidly growing area of robotics, in which there is a shortage of trained technicians capable of monitoring and servicing the expanding array of industrial robots (Stauffer 1981). Shortages of trained technicians are also appearing in the use of computer graphic technologies, biomedical engineering technologies, and electro-optical equipment."

#### Vocational Education's Response

Many vocational schools and technical community colleges have established high technology programs, including the following:

- o North Lake College in Irving, Texas, offers an associate degree program in precision optics fabrication. Students who are either employees of Texas Instruments or selected by that firm learn how to fabricate lenses for a forward-looking infrared (FLIR) system used in weapons guidance, tank fire control, and airborne targeting. Upon successful completion of the first academic period of 10 weeks, students are automatically promoted by the firm to Job Grade 7 and assigned to a shift at the firm's plant for on-the-job training, receiving evening instruction at North Lake College. Students require approximately 2.5 years to complete the program, achieving a skill level equal to that normally acquired after 4 to 7 years of on-the-job training. Equipment now on loan to North Lake College will eventually be donated; and skilled workers trained through this arrangement are judged by Texas Instruments as being superior to those trained by other means.
- o Macomb County Community College in Detroit, Michigan, offers its students three different curricula in robotics, ranging from automation welding to a complete sequence of basic electronics, hydraulics, pneumatics, controls, circuitry, automatic lubrication systems, and mechanical drives and linkages. Students at the school learn to install, program, and maintain an Auto-Place robot, a Seiko robot, and the more sophisticated Unimate 2000 robot; and gain further hands-on experience at four local robotics firms. The first class graduated in 1981, but 400 potential students had to be turned away after the program was filled.

Looking toward the future, the Assistant Secretary for Vocational and Adult Education has created a High Technology working group to involve the private sector in gearing up vocational institutions for these new

programs. In addition, a contract was let during 1981 to Conserva, Incorporated, to assess all high technology developments and relate them to existing vocational and technical education programs that will need new instructional components.

## INNER-CITY INITIATIVES

### The National Need

On March 23, 1982 the President transmitted his "Enterprise Zone Tax Act of 1982" to the Congress. While also encompassing depressed rural areas, this Act recognizes the special economic problems faced by the Nation's inner-city cores. During the past two decades, business and industry have increasingly moved to the suburbs; property and services have been deteriorating; and concentrations of the unemployed, minorities, and the unskilled have been building. As has been demonstrated by numerous studies, these three types of concentration largely overlap each other. While the proposed legislation emphasizes various tax incentives; the President's announcement includes the recommendation that both States and localities might supplement these incentives with their own initiatives in areas such as job training.

### Vocational Education's Response

Until the mid-seventies, the record shows that modern vocational education largely followed the same path to the suburbs as expanding business and industry. While this trend has not been entirely reversed, there are recent instances throughout the Nation where both States and localities have already acted to provide the benefits of quality vocational education to inner-city districts; districts that typically are burdened by obsolete facilities. In both of the following examples, it is worth noting that the new facilities and their acceptance could not have been achieved without the intimate involvement and support of both the private sector and community organizations.

- o The City of Detroit and the State of Michigan are completing a system of five citywide vocational-technical education centers, each offering its own training cluster. One center opened in 1980 and two will not enroll students until the fall of 1982; however, the remaining two began operations during 1981: the Breithaupt Center, featuring food technology, auto mechanics, electricity and electronics, and appliance repair; and, the Randolph Center, featuring the construction trades, business education, and computer electronics. The total investment in all five centers is estimated at \$55 million, of which \$27 million will be Federal Vocational Education Act funds. During 1981, total enrollment reached 2,942 students, most of whom are from minority groups. According to State officials, local firms were extensively used in developing curricula and center designs; and, acceptance by these employers and community groups of center output has been almost unanimous.

- o The City of Boston and the Commonwealth of Massachusetts chose a somewhat different approach than Detroit in solving the City's long-standing problems in the area of skill training. Prior to 1980, Boston's system consisted of quality cooperative programs operated out of high schools at the city's outer reaches; however, the inner city (especially Roxbury, the black community) was served by a rapidly deteriorating trade school originally built in the early 1900's. A cooperative effort was mounted by the Boston public schools and the State Department of Education, abetted by a "Tri-Lateral Council" initiated by the city's business and financial institutions and by community-parent advisory councils. This effort culminated in a \$38 million "occupational resource center" serving two "shifts" per day of 1,800 students each, from 18 sending high schools, as well as adults. The center is located in the heart of Roxbury, 65 percent of its students are minority youth, and 21 percent are handicapped. The Tri-Lateral Council, organized labor, and community groups continue to provide strong consultative services for the center's programs. For example, Digital Equipment Corporation of Maynard, Massachusetts, loaned a top computer specialist to the center, who has developed its entire computer technology program. However, no Federal Vocational Education Act funds were used for construction or equipment and the State reimbursed the City for 75 percent of its expenditures. It is also important to note that non-public school students make up a significant part of the center's enrollment.

Because of the need to involve vocational education more forcefully in efforts to aid inner cities, the Office of Vocational and Adult Education negotiated a contract late in 1981 with the National Academy of Sciences' National Research Council to investigate these needs (as well as those in depressed rural areas) and to recommend how vocational education might best answer them. This 18-month study will focus on private redevelopment of "enterprise zones" and on unemployed minority youth in those zones. Responsibility for the study will rest with a 14-member Committee on Vocational Education and Economic Development in Depressed Areas composed of nationally prominent business, industry, and education leaders.

#### RURAL INITIATIVES

##### The National Need

To an increasing degree, the problems of densely populated urban areas have overshadowed those of rural areas. However, rural and small communities across this Nation not only are unique and varied, but perform indispensable functions--especially in agriculture. The schools in these localities reflect diversity and, typically, have both knowledge of and concern for the needs of individual students and families. Teachers and administrators are active community members, and parents and community leaders are involved in the operation and activities of the schools. Yet, by their very nature, these schools have problems as well as strengths. Geographic isolation, severely limited financial resources, and Federal/State requirements confront many rural and small schools where there are limited educational and skill training options.

### Vocational Education's Response

During 1981, the Rural Initiatives Task Force of the Office of Vocational and Adult Education completed its work, publishing and distributing the resource document, Rural Education Programs That Work: Sharing Ideas. Through this publication, the Education Department intends to simplify the task of acquiring technical assistance in rural programs, whether from Federal, State, or local sources. The following programs are typical of exemplary efforts identified in 31 States:

- o The School for Practical Nursing in Pineville, Kentucky, in the foothills of the Appalachian Mountains, was created in response to an identified need for practical nurses in an area of high unemployment. This full-time 12-month program (including supervised clinical experience) emphasizes service to students with special needs. Educationally disadvantaged students are referred to a learning center for remedial work prior to admission.
- o The State of Utah, Office of Vocational Education, has developed an "integrated shop program," combining the areas of trade and industrial education, agricultural mechanics, and industrial arts. The objectives include providing more adequate curricular offerings for small high schools by pilot projects in a few schools having these characteristics. Selected schools are also assisted by the State vocational education staff in adapting and improving school facilities to accommodate these special programs. Without this kind of integrated approach and assistance, these schools would be hard-pressed to go beyond basic industrial arts, which is not an entry-level occupational preparatory program.

Also during 1981, the Secretary took preliminary steps to form an Intra-Agency Committee on Rural Education, giving the lead role to the Assistant Secretary for Vocational and Adult Education. This committee, whose work will be described in next year's report, consists of representatives from all 14 units within the Department of Education and will provide the vehicle for a major departmental focus on rural education, as well as the mechanism for performing liaison with other Federal agencies having similar concerns.

## AGRICULTURE

### The National Need

Agricultural production is one area in which the United States has both a clear technological lead over the rest of the world and a significantly higher productivity rate. This production, particularly in grains, contributes \$40 billion annually to the plus side of the Nation's balance of payments. Yet, this high productivity is not without costs: tillable land is rapidly being diminished through conversion to other economic development uses; topsoil is being eroded at an alarming rate; deep water resources are being depleted; and chemical and animal-waste pollution poses serious problems. These developments, together with a continuing decrease in the number of farmers (if not in "combined" fields such as

agri-business and agri-mechanics), demand that future farmers be afforded a wide range of skills in highly sophisticated technologies such as are involved in the operation, maintenance, and repair of computer-based farm equipment and management; and in entirely new agricultural technologies such as hydroponics. As John Block, Secretary of Agriculture, has pointed out, the effective use of these technologies cannot be accomplished through government regulation and heavy penalties, but will depend on the abilities of individual farmers to adapt.

#### Vocational Education's Response

Vocational agriculture is the oldest branch of vocational education; and yet, one of the most active and modern. For example, during the early 1970's the U.S. Office of Education funded a number of curriculum development projects in emerging technologies, among them being that for "electro-mechanical technician." Although not meant specifically for use by agricultural technicians, it is the opinion of specialists in the Office of Vocational and Adult Education that some of the best instruction for potential technicians of this type is offered within vocational agriculture programs. Since exemplary programs exist in all 50 States, it may be more useful to report on two special aspects of all these programs that are basic to their quality, technical scope, and responsiveness:

- o No other program has developed a student organization more widespread or effectively integrated with its instructional program than has vocational agriculture. The Future Farmers of America has chapters in all 50 States and one Territory. FFA membership increased to 565,611 during the 1980-81 school year: 482,611 at the secondary-school level (8,236 chapters); and 83,000 at the postsecondary-school level (340 chapters). The vitality of the organization is demonstrated by the fact that the postsecondary segment has only been in existence since 1979. In addition, vocational agriculture features a Young Farmer Program that instructs working farmers and their spouses in the latest technological developments and in other areas that will improve their productivity and lives.
- o A collaboration of local, State, and Federal agricultural education specialists, aided by the Iowa State University, has been working since 1976 on the development of national standards for all branches of and activities in the field. Various modification and validation activities continued during 1981; and will extend indefinitely into the future as new technological elements must be inserted. This project has not only provided a model for continuous program modernization but is an excellent example of how Federal staff can provide support to States and localities in national activities which they initiate; and how this can be accomplished without intrusiveness.

Because of the vital nature of agriculture in the Nation's economy and the need for effective training in new technologies, the Assistant Secretary for Vocational and Adult Education, last fall, developed a plan for

expanded services to the States which will be implemented later this year, to the extent that resources permit.

## DOMESTIC ENERGY AND MINERAL PRODUCTION

### The National Need

The problem of energy and non-renewable mineral resources has critical significance for both economic revitalization and defense preparedness. There are two aspects of this problem: adequate supply, and cost. In the short term, the decreased consumption of foreign oil, plus increased domestic drilling by American firms, has increased the Nation's self-sufficiency--a major goal of this Administration. However, the outflow of American cash to OPEC nations will still be a staggering \$60-80 billion during 1982; and, according to a recent announcement by the President, the acquisition of strategic minerals for defense industries represents a major challenge. While the emphasis, for the present, is on fossil fuel sources of energy, most studies see the ultimate solution as a mix of all sources: fossil, nuclear, solar, and synthetic. On this assumption, and given the goal of national self-sufficiency for a rapidly expanding economy, it has been projected that an additional 72,000 jobs directly related to energy production will be created by 1990, a large proportion of which will be in the skilled crafts for which vocational education can conduct training.

### Vocational Education's Response

Vocational education's response to the Nation's energy problems has been conditioned by the emphasis that the 1976 Amendments placed on solar applications and coal technology, both at the postsecondary level. For example, of the 10 energy programs nominated for the Secretary's Award for Excellence, seven involved solar energy techniques; however, one focused on liquified petroleum gas technology and the remaining two combined a variety of energy applications as they affected traditional vocational education programs in the building trades and heating-air conditioning, among others. The following examples suggest that the response has occurred in still other directions and in close collaboration with the private sector:

- o At the request of the Kansas Independent Oil and Gas Association, three Kansas community colleges jointly implemented a multi-campus pilot training program for rigbuilder helpers, rotary drill helpers, roustabouts, and pumpers. The program uses inservice learning strategies involving industry-produced audio-visual materials and community college instructional staff.
- o The Colorado Coordinating Council for Mine Training was established in 1980 and fully operational during 1981. The membership includes representatives from the postsecondary schools active in coal and oil-shale miner training, State agencies concerned with manpower supply and mine safety and health, and the mining industry. Industry input into the council is supplemented through the various training committees of the mine operators' associations.

Planning and program funding was provided to four postsecondary institutions offering pre-employment upgrading, skill training, and legislated mine safety and health instruction.

## ENTREPRENEURSHIP

### The National Need

In this age of giant corporations, the importance of small businesses and entrepreneurs is easily overlooked. However, firms with less than 100 employees provide approximately 75 percent of new job openings, as well as roughly the same proportion of technological innovations. There are 14 million small business owners in the Nation and 500,000 new small firms begin operations each year. The success or failure of these small firms impact on each of the national needs and responses already described. According to a recent study by the Small Business Administration, bankruptcies of small businesses increased by 32 percent between 1980 and 1981, and total business failures for this type of firm grew by 42 percent during the same period. Findings of the 1980 White House Conference on Small Business state that 80 percent of all small businesses fail within the first 5 years of operation; and that nine out of ten small businesses fail because of poor management. Specific reasons include: lack of planning, inadequate controls, poor accounting methods, inability to read and understand financial statements, and inability to locate expert advice when needed. These facts, implying high personal and financial costs to individuals and the economy, strongly suggest that training in small-business management skills must be made more generally available to entrepreneurs, and to prospective entrepreneurs, throughout the Nation.

### Vocational Education's Response

Elements of entrepreneurship education have always been present in vocational education programs; however, entrepreneurship as a distinct field for instruction has developed over the past few years. Many of the newer type of programs are now offered throughout vocational education, both for school-age youth and older adults. The "foundation" program in the Montgomery County, Maryland Public Schools not only provides an impressive example of entrepreneurship instruction, but also illustrates a creative mechanism for collaborating with the private sector.

In the Montgomery County program, students actually "practice" entrepreneurship while learning their chosen crafts. The mechanism consists of nonprofit foundations whose memberships are drawn from business, professional, and school communities concerned with specific occupational fields. These foundations make possible the operation of "mini-businesses" by students, thus providing hands-on entrepreneurial experience rather than just classroom instruction in these skills--valuable as this instruction may be. For example, under the Construction Trades Foundation, Montgomery County students have built and sold four homes during the last 4 years. In this process, the students have worked with business people on all aspects of the project from architectural drawings, construction, and interior and exterior design to sales and marketing. As a second example, students have a bona fide franchise, under the Mini-Auto Dealership Foundation, to recondition, repair, and sell used

cars. The foundation must contend with the same rules and regulations as any other local dealership. After gaining this kind of entrepreneurial experience, the participating students enter the automotive business with a clear-cut advantage over students who lack this experience and have not had the opportunity to learn business development and management techniques from successful businessmen and professionals.

In September 1981, the Assistant Secretary for Vocational and Adult Education assembled a new in-house Task Force on Entrepreneurship Education (TFEE) with the mission of assuming leadership and responsibility for providing clear direction at the national level and for promoting and expanding entrepreneurship education and training as an integral part of vocational and adult education. The mission focuses particular concern on orientation and exploratory experiences for young people, preparation of potential business owners, and developing and upgrading survival skills of business owners. TFEE has the overall goal of infusing entrepreneurship education and training in all vocational and adult education programs, and eventually in all of education. The general objectives of TFEE include establishing an ED clearinghouse, disseminating information about relevant successful and replicable programs and delivery models, and coordinating Department of Education efforts with relevant programs in other Federal agencies and with the private sector.

**APPENDIXES**

APPENDIX 1. FUNDING TABLES 1979-80

- F-1. Expenditures by State (sum of Sections 120, 130, 140, and 150)
- F-2. Outlays for Section 110, FY 1979 and FY 1980
- F-3. Outlays for handicapped under Section 110 by State
- F-4. Outlays for disadvantaged under Section 110 by State
- F-5. Outlays for LEP under Section 110 by State
- F-6. Outlays for adult and postsecondary under Section 110 by State
- F-7. Outlays for Section 120 by year and program
- F-8. Expenditures for Section 120 by State
